"As the eyes of Lynceus were said to see through the earth, so the poet turns the world to glass, and shows us all things in their right series and procession. For through that better perception, he stands one step nearer to things, and sees the flowing or metamorphosis. . . . The poet alone knows astronomy, chemistry, vegetation, and animation, for he does not stop at these facts, but employs them as signs."—EMERSON: *The Poet.*

Jan. 12. 85.

Dear Dr. Berdoe,

What can I hope to say in return for such sympathy and generous desire to take - in the case of my endeavours in poetry - the will for the deed? I am rewarded over and over again a hundred fold for whatever pains I have taken by - were it only one such testimony to their result - as goodness like yours chooses to estimate it. All I require acknowledgement for is simply that I have aspired to give effect to my own convictions and would prefer success in that direction to any other. For your help in this respect, pray believe me, Dear Dr. Berdoe,

Yours gratefully ever

Robert Browning

INTRODUCTION.

As I stood by the grave of Mr. Browning in the Abbey crowded with representative men and women famous in Art, in Science, and in Letters, when he was honoured by the nation in being voted by acclamation a place amongst our immortals, and welcomed, as it seemed to most of us, I think, who were present on that grand and solemn occasion by his peers who seemed to look down approvingly from their sculptured tombs, I thought of all the hard things the thoughtless world had been saying of the great poet these many years, and how late in coming were the recognition and honours which culminated in the pomp and dignified ceremony of that day, and I mused on the lines in his *Paracelsus*, where the hero says so sadly,—

"'Tis only when they spring to heaven that angels
Reveal themselves to you; they sit all day
Beside you, and lie down at night by you
Who care not for their presence, muse or sleep,
And all at once they leave you and you know them!
We are so fooled, so cheated!"

We have indeed been fooled and cheated out of our rights in Browning's noble verse all these long years. We have permitted wretched scribes, who had no sympathy either with the motive, the method, or the genius of the poet, to tell us,—we were too indolent to see for ourselves,—that this man's work was not poetry at all,—actually took a miserable creature's word, who wrote of *Bells and Pomegranates* the single critical assertion, "rubbish!" and let him write on, nothing heeding, the bravest, most bracing and virile body of literature that has emanated from any English author since Shakespeare. Now we are finding out our mistake, and it is to be feared that our last state will be worse than our first. Browning will become fashionable, everybody will read him, everybody praise him; and this will be as uncritical and false as was the previous neglect and contumely.

Several years ago a speaker at one of the meetings of the Browning Society said that "the *students* of Browning would find immediate profit in his works, though those who only read him for amusement would usually be disappointed. He was not anxious to see

Browning 'popular' in the vulgar sense. In the nature of things he never could be popular with the mere reader who does not care to exercise his brains. But if a student would invest thought in his work, he would be a thousand-fold repaid for his venture. What he dreaded was an affectation of admiring Browning without an effort to understand him." The affectation will come soon. It will be idle to maintain that Browning presents no difficulties to his readers; it is, however, still more idle to affirm, as some do, that he is purposely obscure. He does require study, but he will repay it abundantly, which is a great deal more than can be said of many things which occupy intelligent minds. "Lofty mountains," as has been well said, "enshroud their heads with clouds"; and if Browning is often obscure, it must be conceded that his subjects are usually concerned with the deepest problems which agitate the human mind. It is not possible to follow the intricate windings of the human heart in the phraseology and methods which suffice for the ballad, the epic, or the drama of mere action. Browning is always subjective, and probably will never appeal to any great

extent except to the class of mind which delights in the analysis of our motives.

Of course this class will gradually widen, for the analysis of human nature and the search after the hidden springs of conduct will grow with the improvement in our methods of education. The fact is, Browning is in advance of his age; but there are some to whom this will be no objection. He will prove most useful to the large class of thinkers who have broken away from dogmatic Christianity on account of supposed scientific difficulties which stand in the way of their unqualified acceptance. Browning is not only a Theistic poet, but he is a Christian. No Church can label him and pack him away in its cabinet; but for all that his works bear abundant testimony that the great doctrines of the Christian faith were heartily accepted by him, and accepted upon grounds which seem to many to be more satisfactory than those on which they are generally presented by theologians. He never asks his readers to shut their eyes and open their mouths; he always says, "Open your eyes, look, see why this is. How good it is that it should be just this way!" "A scientific faith," of

course, as he says, "is absurd"; but he gives us so much reasonableness for our belief, that it is in some cases stronger than would be mere cold mathematical proofs, *if* it were possible to obtain such. So catholic were the great poet's sympathies, so all embracing his love for every earnest endeavour after truth and righteousness, that some narrow-minded Christians, as they could not encircle him within their contracted boundaries, have not scrupled to doubt his Christianity. On the other hand, many non-theists profess to find evidence in some passages of his works that the real Browning was not a believer himself, but only spoke dramatically when uttering Christian arguments. Candidly, I must say that I do not believe Browning was enough of a dramatist to escape from himself in any of his poems; and as every one of his characters talks Browning, it follows that a good many Browning thoughts find expression in his works.. I have quoted in the following pages passages enough to prove this to all except very hardened theorists. But I have even stronger proof of my contention. Mr. Browning's books had been of such service to my own mind, that I once wrote to acquaint

him with the fact, when I received the following letter :—

"19, WARWICK CRESCENT, W.
"*Jan.* 12*th*, '85.

"DEAR DR. BERDOE,—

"What can I hope to say in return for such sympathy and generous desire to take in the case of my endeavours in poetry—the will for the deed? I am rewarded over and over again a hundred-fold for whatever pains I have taken by—were it only one—such testimony to their result as goodness like yours chooses to estimate it. All I require acknowledgment for is simply that I have aspired to give effect to my own convictions, and would prefer success in that direction to any other. For your help in this respect, pray believe me,

"Dear Dr. Berdoe,
"Yours gratefully ever,
"ROBERT BROWNING."

If the young men and women of the present day who think that the old religion which nurtured and sustained their parents is no longer adapted to folks who have attended courses of science lectures and taken degrees

in arts, could be induced to extend their studies so far as to honour our poet, with a few months' attention, I venture to think, they must ultimately at least admit that Christianity has something to say for itself after all, and even that it is not absolutely inconsistent with a science degree to yield obedience to its claims. Our young people, I believe, have given up saying,—

> "Twinkle, twinkle, little star!
> How I wonder what you are!"

Since astronomy and spectroscopic chemistry have become popularized, I am told they say now,—

> "Twinkle, twinkle, little star!
> I don't wonder what you are!
> What you are I know quite well,
> And your component parts can tell!"

These are the sort of persons who would be vastly improved by a course of Browning; and my only feeling of complacency in the advent of the Browning fashion is connected with the conviction that some of these clever young ladies and gentlemen will, before long, have to discover how little they really know after all.

With the exception of one essay in this

volume—that on Rabbi Ben Ezra—the various articles were originally read as papers before the Browning Society, or delivered as lectures to larger audiences. This will account for a phraseology and style which in many places is obviously that of the platform.

I trust I shall not be accused of presumption in offering to a wider public than that for which the following papers were originally intended my thoughts about Mr. Browning's works; but I am impressed with the hope that they may lead some troubled spirits to reconsider their attitude towards the great truths of religion, and to find rest for the weariness of their souls in a return to the faith which is as true and as necessary for the man of science as for the child at its mother's knee.

In several places it will be noticed that there is some slight overlapping in the various papers, and a thought or quotation is now and again repeated. It was not desirable to break the continuity of the thought by excising such passages, especially as they generally present the recurring idea in a slightly different form.

BROWNING'S MESSAGE TO HIS TIME.

As this nineteenth century draws to its close, while the struggle between faith and scepticism has passed into the acute stage; while our philosophers and men of science chant peans over the downfall of creeds and superstitions, and hail with shouts of joyful anticipation the coming of the age of science; while the foundations of orthodoxy are being undermined by criticism and the study of comparative religions; there are not a few anxious souls, who amid all this destruction are eagerly asking: "What is to take the place of the banished faith? What are we going to write on the *tabula rasa* the end of the century will have left us? How are we going to teach our children? How rule the people? Is the moral law Divine, and are its sanctions eternal? or may we change our ideas of what is right and wrong, as a railway company varies its bye-laws?"

A sad picture has been drawn in a recent review of a possible "faithless world," with its

"belittling of life," and its gospel of despair. It has been said the picture is an impossible one; but those who have studied the question most deeply seem to think it will sooner or later be realized in fact. In the beautiful words of Matthew Arnold,—

> "The sea of faith
> Was once, too, at the full, and round earth's shore
> Lay like the folds of a bright girdle furled;
> But now I only hear
> Its melancholy, long, withdrawing roar,
> Retreating, to the breath
> Of the night wind, down the vast edge's drear
> And naked shingles of the world."

"Go into a London club, listen to the talk of men of the world on moral questions, and see how little of earnest faith in any moral law is left among them. Compare the talk with what it was twenty-five years ago. Then it was an offence to affect doubt of any fundamental principle of orthodoxy. To express unbelief was to invite insult; to assume that your neighbour could be anything but an orthodox Christian was to affront him. Now-a-days even conservative society rather patronizes religion than believes in it, and a similar scepticism prevails on points of morality. A man

may to-day affirm that marriage is an absurdity, may challenge the first principles of social order, might have defended murder till the assassinations committed by Land Leaguers and Nihilists frightened society into a passion on that subject,—may argue against any of the ten commandments, and will be answered in almost equal terms."

Such is the indictment against our time which a recent essayist puts into the mouth of one of his characters in a controversy on Negative Science and Natural Ethics (Percy Greg, *Without God*, p. 169).

A short time since I had a letter from Berlin about Mr. Browning's new book, *Ferishtah's Fancies*, from an eminent man of letters, in which the following passage occurs: "If I am irresistibly impelled to hate the evil, cruelty, brutality of the world, what consolation is there in telling me about its Creator and Perpetuator, unless it be to make me hate Him? Browning needs a limited God for dramatic purposes; a God selling Himself to Satan, but an omnipotent God for metaphysical purposes. He cannot have both. For myself, I have, as you know, been compelled to leave my religion in

the only certainty that is left me—the certainty that justice, kindness, love, are good, and the only evidences of good in the universe. But as they are not so strong in the earth as injustice and inhumanity, how can I say they are omnipotent in the universe? 'They may be,' but how can I build on a 'perhaps' I have not been able to find? (As if all our life we were not just doing that!) When I can find a man or woman who can show me a higher type of God than some crucified or mendicant lover of men, I shall believe in Omnipotence."

To talk like this has become the fashion of the day, not only with our writers in magazines and reviews, but with the students of our colleges and the half-educated youth of both sexes. Canon Liddon, in a sermon at St. Paul's, said lately :—

"An acknowledgment of Christ too often was met with a delicate curl of the lip, a gentle shrug of the shoulder, a scarcely perceptible raising of the eyebrows, which were more terrible to some young men than to have to lead their regiment across a plain swept by the enemy's cannon. These expressive attitudes were meant to say, 'You do not mean

to tell me that at this time of day you believe these old fables?' These sneers," Canon Liddon continued, "which did their work with such fatal effect, represented not superior knowledge, not high moral principle, not complex superiority, but were the extract or essence of a certain form of class opinion, or rather section or subsection of opinion, the holders of which wish to establish without argument the idea that Christ had had His day."

The Canon then gave an account of a dinner party at the West End fifty years ago, where, when the ladies had retired, the conversation, under the direction of one of the gentlemen, took a turn utterly derogatory to Jesus Christ. A guest asked his host's permission to ring the bell, and when the servant came ordered his carriage, saying with the courtesy of perfect self-command that he was sorry that he was obliged to retire, but that he was still a Christian. This act of simple courage was that, not of a bishop or clergyman, but of the great Minister of the early part of Queen Victoria's reign—Sir Robert Peel. The preacher pointed out that while Christians were

less and less courageous, more and more fastidious, so afraid of being too enthusiastic, and so engaged in weighing or mincing their words, every conceivable blasphemy, folly, and negation of the truth appeared in the press, and was discussed in society, while error, moral and intellectual, stalked everywhere, now loudly advertising, now gently insinuating itself.

That some half-a-dozen eminent Englishmen of science have cast off what they are pleased to term the trammels of superstition, and at the same time live pure and noble lives, does not for a moment prove that the great mass of ignorant mankind can be decent members of society, good fathers and mothers and worthy citizens, without faith in God, the existence of the soul and the conscience. A few philosophers may succeed in doing this, though neither Voltaire nor Rousseau nor, indeed, any others of whom we have complete information, as far as I can gather, led lives that would for a moment compare with the purity, gentleness, modesty, and beauty of those led under the eyes of us all by simple folk nurtured in the faith we talk so lightly about parting with for ever. Many prophets have come amongst us

and spoken great truths to us. The voice of Carlyle has only just ceased, with that of Emerson, to rebuke our shams and our low-mindedness; while that of Ruskin still cries aloud for truth and reality and earnest, honest heart in work and word.

But there is one prophet who has none of Carlyle's bitterness and distempered views of life, none of Ruskin's far-fetched theories and impracticable mediævalism, none of Emerson's vapoury transcendentalism, so beautiful to contemplate, so hard to condense into anything usable—Robert Browning, well described by the founder of the Browning Society as "the manliest, the strongest, the life-fullest, the deepest and thoughtfullest living poet, the one poet needing earnest study, and the one most worthy of it." *

I once heard Mr. Russell Lowell say, 'Browning is the poet who stays by one longest." From the comparatively few persons who are lovers or admirers of Browning, though the circle is a daily widening one, it may per-

* Dr. Furnivall, in the inaugural address to the Browning Society.

haps be surmised by the inconsiderate, that either he is not understandable or not worth the trouble of understanding. Doubtless, every one has met advocates of both of these theories. It is getting a little too late in the day, however, to be able to take refuge in the latter suggestion, which even the *Saturday Review* has had to abandon; and the only excuse one hears much of now from those who are not Browning's admirers is the former, that he is too obscure, too involved, too rugged, to make anything of. One of our most eminent living women of letters, whom I asked to write a paper for the Browning Society, recently declared to me she had tried to understand our poet, but could make nothing of him, and added: "When I am tired and want my mind refreshing, I like to put my head down into a great big cabbage-rose like Tom Moore; and you urge me to bury my nose in a bunch of thistles like Browning." Now, I have come to the conclusion, that much of this talk of the obscurity of Browning is affectation, simply a form of cant. I do not use the term offensively, but in the sense Webster gives: "The phraseology of a sect used without sincerity." People who

declare that *In Memoriam* presents no difficulty to them at all, make wry faces at *Paracelsus*, *La Saisiaz*, or *Fifine*, and say it is no use trying, it is all beyond them, and worse than the higher mathematics. Browning has a sorrowful line which we should blush to read.

> "Ye British public who like me not,
> God love you, whom I yet have laboured for."

And in one of his poems he very caustically compares the great poets of England,—Shakespeare, Milton, Spenser,—to butts of precious wine, that stand in our cellars but are rarely tasted. We swear by them, he says, but how much have we had out of the casks? You know this is not a very honest age, it would hardly do to speak ill of Shakespeare and Milton and Spenser; but, after all, how many glasses have we had out of these butts?

I have met many who have read Browning once, and did not like him. I have met some who have read him twice, and said the same; while those who took the trouble to read him over and over again, found their profit in the labour.

Precious stones do sometimes want digging

for. Diamonds and nuggets are not always to be stumbled across on the footpath. Pickaxes and crushing mills are not unknown in mining operations; and the treasures of kings are kept in strong boxes. The bee cannot gather his honey from the simplest flower without contributing his quota to the processes of fertilization; and the stimulation of our thinking faculties is no small part of the good which great teachers have to do for us. The quartz will pay for crushing, the diamond for digging. By the nature of the treasure we expect a certain trouble in getting it. Some one cleverly said, "Browning treats obscure subjects deeply, not deep subjects obscurely." When we remember that he discourses on the great problems of life and mind, that his songs are of soul struggles and the birth-throes of great thoughts, we shall not expect them to be clothed in language of a love song, or the words that befit a hymn to a daisy.

Carlyle somewhere complains, "How loth we are to read great works! How much more willingly we cross our legs, back to candle, feet to fire, with some *Pickwick* or lowest trash of that nature! The reason is, we are

very indolent, very wearied and forlorn, and read oftenest chiefly that we may forget ourselves."

One difficulty about Browning, I may mention in passing, is the intensely concentrated form in which all his great thoughts are cast. This, it has been remarked, is the tendency of all the greatest writers of the age; they suggest rather than vapour, they compress instead of being diffuse, and take for granted that we can do without platitude, often giving their readers credit for more knowledge than they possess. This latter charge, I admit, *can* often be fairly brought against Browning. If you were familiar with the Encyclopædia as with a horn-book, you would have all your work cut out to keep up with him; and he seems to expect this of us rather too rashly. You can't read him for mere after-dinner amusement, as you take up Thomson's *Seasons* or Cowper's *Task;* but if you take his *Paracelsus*, the *Inn Album*, or indeed any of the earlier poems except *Sordello*, with the attention you would expect to give to an article in the *Quarterly*, you shall rise from the study a manlier man, a stronger and more earnest seeker after the

true, the noble, and the good, than when you first opened the page. You will be braced as the traveller who leaves the hot, dry plains for the mountain heights.

But we do not invite you only to snow-clad altitudes, we do not want to bury you on Alpine heights.

Every line of Browning is stamped with his strong personality. He is nothing if not virile, as becomes a man with a message for a limp and gelatinous age. He is analytical and subjective in a most marked degree, as becomes a teacher of an age of science.

All his students say, "How strong he is!" One feels he is safe to trust—a Mr. Greatheart in a world whose leaders seem weak-kneed beside him. While the religious teachers of the day are lamenting the decay of faith in the first principles of religion, and the very idea of a divine revelation has become repugnant to so many, Browning, holding no brief from any of the Churches, comes forward to boldly call the science and philosophy of the day back to religion, declaring that Love,—God's love,—is the only thing that can keep the intellect of man from madness, as the brain must cease to

perform its work efficiently when the heart's work is imperfectly done. He re-states Christianity on its earliest, simplest, and too forgotten lines, contests the ground for an exalted Theism of the noblest kind, and proclaims that the great truths of Christianity rest upon philosophical and scientific foundations, that though the superstructures built on them by some Churches and some theologians are too often weak and rotten, the great truths of God, the soul, and the future life remain amid all the storm of adverse criticism unharmed by a single wave that has beaten upon them.

With the truest sympathy with all the doubts and difficulties of belief, he invites us to follow him on a path with whose every turn he is familiar.

> "Rather I prize the doubt low kinds exist without,
> Finished and finite clods untroubled by a spark."

I know no thinker on religious subjects so worthy of confidence as he, because he is well abreast of all the scientific thought of the age. Few even of Browning's closest students are aware how thoroughly imbued with science he is; and though I believe that the poet is the natural king of men,—

"A poet must be earth's essential king,"

as he says himself,—he is so much the more a king when he is master of all his subjects' needs.

He feels quite sure that, although our processes of thought are perhaps due to certain definite molecular changes in the grey matter of our brain, which abstract so much of the sulphates and phosphates from its blood supply, these changes are not the thought itself, as the Materialist claims.

You will not easily blind Robert Browning with a handful of physiological dust, nor daze him with a show of chemical formulæ. He knows just as much about physiology and natural science in general as the Materialist and Agnostic; and he tells you that neither their scalpel, their crucible, nor their microscope have brought us the least step nearer to finding out the mystery of being—

> "To know of, think about—
> Is all man's sum of faculty effects
> When exercised on earth's least atom, Son!
> What was, what is, what may such atom be?
> No answer! Still, what seems it to man's sense?
> An atom with some certain properties
> Known about, thought of as occasion needs,

> —Man's—but occasions of the universe?
> Unthinkable, unknowable to man."
> *Ferishtah's Fancies*, p. 131.

One of the chief characteristics of a great poet, is a very high development of the faculty of observation. To bring that faculty to perfection, there must be added an acquaintance with almost the whole sum of human knowledge. In writing a paper on Browning as a scientific poet, I have been amazed at the vastness of the field of human knowledge explored by our great poet. Be sure, therefore, that if he is a Christian poet, as he certainly is, he can give the world very cogent reasons for the faith that is in him. Such a teacher at such an epoch has a message for his time of peculiar force and significance. If the world, turning its back on the altar and the pulpit, has steadfastly faced anything now-a-days, it is the Professor's Desk, of which it asks, "Who will show us any good?" I think the voice from that chair of science will more and more clearly pronounce in favour of Christianity. It has already done so in Germany, where the highest thought is no longer agnostic or sceptical; and I see in the whole scientific thought of Browning, and the

way in which he is influencing the highest intellect of our country, marked evidence that "the watery swell of rationalism is going down" here also. Did I startle you when I read that terrible indictment of my atheistic correspondent from Berlin, who, because he sees a very imperfect world, denies the existence of a perfect Creator and Perpetuator? I could reassure you out of Browning, who in a hundred noble passages tells us that the evil, and cruelty, and hate, and vice, and pain in the world are not purposeless, as they perhaps seem to our limited knowledge.

All this dread machinery of pain and sorrow, he believes,—or he would otherwise be confounded by it,—was devised to evolve the moral qualities of man, and "wring from out all pain all pleasure for a common heritage." As the crystals branch where the salt marshes stagnate, as blood dries to crimson, so in every shape is evil beautified—after all, evil is a result not less natural than good, it must therefore have a purpose. This is a low reason, perhaps; he gives us a higher one—evil must stay for men's own account,—

"For mankind springs

Salvation by each hindrance interposed,
They climb."

Living itself, properly understood, is made up of good and evil. Failure may be, after all, only apparent. His optimism is so far-reaching that, contemplating the corpses in the Morgue, he can say that he hopes—

"That what began best, can't end worst,
Nor what God blest once, prove accurst."

We can only see the goodness of God by means of evil, only appreciate the serenity of heaven through the noises of earth, only win our souls by fighting the wrongs and pains of life. God's love is at issue still with sin visibly when any wrong is done on earth. There is a need for sin and death,—happily only a transient one,—there is Power sufficient for righting all the wrongs of life, and through Love the power will be resumed.

Amelioration is the dominant note of Nature, the lily is the evolution of a grass; the monstrous and terrible forms of giant strength that wandered through the mists of the half-cooled earth, ages before the advent of man,—

"When dragons in their prime
Tare each other in their slime,"—

have long since given place to gentler forms, and the earth is no longer held in subjection by the muscle and giant bone of the megatherium, but by the convolutions of the human brain. What this world may yet become, may be in some slight degree imagined if we in fancy transport ourselves to those distant ages of the past before the advent of man, and compare its condition when hideous monsters roamed its tangled forests with the present age of civilization. May we not hope that the hateful forms of vice, cruelty, disease, and sin, may, like the extinct monsters of past geological periods, disappear before the softening influence of virtue, knowledge, and love? Browning finds reason for such a hope in a similar reflection.

> "Dragons were and serpents are,
> And blindworms will be; ne'er emerged
> Any new-created Python for man's
> Plague since earth was purged."
>
> *La Saisiaz*, p. 57.

We must never forget in this relation, that a very large proportion of the evil in the world arises from violation of the moral law, written plainly in the conscience of man. Browning says, If you break the law of gravity, you must

ot complain that the air does not hold you up hen you step over a precipice. Just so with oral evil. If you will be lazy and vicious, you ustn't grumble at being poor and ill. It is simply a question of cause and effect.

We have liberty of doing evil, that our doing good may have a grace. Nature's law is very simple: such effects succeed such causes. Heaven and hell depend upon man's deed on earth just as certainly as you make point meet point or miss it by the straightness or crookedness of the line you draw between them. If you want to live on earth, draw your breath; if you want to have eternal life, be just! Death in either case results from breach of law.

Browning's conception of God is a very noble one. He *sees* God in the immensities, he *feels* His love in his heart. God stands away a hairbreadth off—

"To give room for the newly made to live."

Man is able to grieve, but able also to glorify God, as no mere machine could do—

"Made perfect as a thing of course."

With him evil is always the accident.

"This is the note of evil, for good lasts."

In the darkest life he sees reason for hope. In the most criminal soul he detects the potentialities for good.

"Progress is man's distinctive mark alone,
Not God's, and not the beast's: God is, they are,
Man partly is, and wholly hopes to be."

A Death in the Desert.

Is the whole world groaning under its load of pain? He says,—

"Put pain from out the world, what room were left
For thanks to God, for love to Man? Why thanks,—
Except for some escape, whate'er the style,
From pain that might be, name it as thou mayst?"

Browning's idea of God, as might be expected from so subjective a poet, is largely abstract. Not that he opposes the concrete conception of the Divine Personality as revealed in the Bible, but because, valuable as the anthropomorphic Hebrew idea of God was, the larger and wider our thought of the Supreme Being becomes, the healthier and more ennobling it will be for mankind. For a world emerging from fetish worship and Polytheism it was a vast stride to arrive at, that one anthropomorphic God; and, notwithstanding all the scoffing of anti-theistic or a-theistic opponents,

hat Hebrew Javeh was a most elevated conception, the highest the mind of the time was ble to bear. Is the world ready, even yet, for perfectly pure faith?

In the character of Pompilia, in *The Ring and the Book*, he has portrayed how the soul of his heroine was made perfect through suffering, and shows how a mere child, ignorant of the world and all its ways, with neither advantages of home, education, or any congenial surroundings, through suffering, and suffering only, escaped all at once from the mere animal existence to all the grace, the dignity, and beauty of the highest type of womanhood, as the chrysalis, in one bright hour, from the dull earth below, bursts into the summer air with gold and glory on its wings. The poor murdered creature sees how suffering has raised her—

"One cannot both have and not have, you know,—
Being right now, I am happy, and colour things."

sees the good of suffering when she hears God say—

"Bear! not stand by, bear to see My angels bear";

and owns that though—

"In His face is light,
But in His shadow healing too,"

she does not think less of God for being cru fied or mendicant, but says :—

> "I never realized God's birth before—
> How He grew likest God in being born."

Dr. Furnivall has well described our poet the "healthfullest" of the day. It is very tru and the man or woman who aspires to tea anything to this century must first of all *healthful.*

I think the day has gone by when poets unsound mind have much in them to bless t world with. This man has a sound mind in sound body. Hear him. Of course, being scientific poet, he is an Optimist. The Evol tionist shows us how animal and vegetab life tend to higher and more beautiful forms especially under cultivation. He is compelled to a large extent, to be optimistic.

Schopenhauer declared life to be utterly un desirable, and painted all the operations o Nature in the darkest colours of his gloom palette, yet one who records a visit to him a home says he did not find the great Pessimis sitting in sackcloth and ashes, contemplatin how best to terminate the miseries of his exist ence, but enjoying life and all its good thing

n a beautiful home with artistic surroundings, nd under conditions generally calculated to ake it an enviable one. Browning lives as he aches. He is not touched with the faintest ace of unhealthy pessimism.

Second to no student of Tennyson in my miration for his *magnum opus*, the *In lemoriam*, and alive as I am to the unisdom of making invidious comparisons beeen two such master-minds, I cannot forbear illustration of my subject, contrasting the *Memoriam* of Tennyson for his friend allam, with the poem on very similar lines, *a Saisiaz*, of Browning in memory of a lady iend who died in Brittany: the former a hrenody, almost a woman's wail over her own eart sorely lacerated by death's severance; the atter a noble psalm of victory of soul over natter and of hope beyond the grave.

If any one doubts Dr. Furnivall's claim, hat "Browning is the manliest, strongest, lifeullest, deepest, thoughtfullest of our living writers," let him contrast these two In Memoriams.

To thine own self be true; he is never tired of emphasizing this!

"Weakness never needs be falseness: truth is truth in ea
degree
Thunder-pealed by God to Nature, whispered by my so
to me."

La Saisiaz, p. 24.

I have in this lecture endeavoured to in
cate some of the salient points of Browning
message. I think I have shown that his gre
thoughts shine over the troubled seas of spe
lative thought as a Pharos, whose light is stro
and clear enough for our greatest needs.
the many extracts I have read, you will
have failed to notice abundant evidence of
manly, strong, life-full, thoughtful, deep p
sonality. If I have adduced any reasons
lead to a closer, more earnest acquaintance wit
him on the part of any here present, I ho
they will not be deterred by the prevalent ide
of his obscurity, but go boldly to work an
fetch out the precious treasures for themselves
they do not lie so very far below the surface
I think he answers some of the deep questio
ings of the soul. It is hard to have to travers
the dark ways of life with no other light tha
the ignis fatuus of our own reason. When th
end comes, may we all say with his Paracelsus

"If I stoop into a dark tremendous sea of cloud,
It is but for a time; I press God's lamp
Close to my breast; its splendour, soon or late,
Will pierce the gloom: I shall emerge one day!"

APPENDIX.

[redacted] following observations, taken from the trans-
[redacted]ns of the Browning Society, on the relation of
[redacted]vning to the nineteenth century, were made from
[redacted]chair at the meeting of the Society on Friday,
[redacted]l 27th, 1888, when—

[redacted]ISS WHITEHEAD read a paper on Robert Brown-
[redacted]s a poet of the nineteenth century, its interests
[redacted]influences, practical and metaphysical.

[redacted]R. BERDOE said that he was sure he expressed
[redacted] feeling of the meeting in very heartily thanking
[redacted]iss Whitehead for her valuable paper. He had
[redacted]tened to it with great satisfaction, partly for its
[redacted]n inherent merits, and partly because Miss White-
[redacted]ad had shown how thoroughly she had studied
[redacted]owning, and had given so much of his best thought
[redacted]his own words. A very difficult question had been
[redacted]lt with, "The Relation of Browning to the Nine-
[redacted]nth Century." He took it that it was necessary for
[redacted]oet of this age to be in sympathy with its aspira-
[redacted]ns, its work, and its need. How far Mr. Browning
[redacted]d met these requirements had often been discussed
[redacted]y that Society; and he hoped Miss Whitehead's
[redacted]aper would enable them to discuss it profitably on

this occasion. The principal aspiration of the a
was a passionate longing for truth, combined with
purity of intention and a reverence of method
truth-seeking, such as, he ventured to say, had nev
been equalled in any age. It was an age of scienc
but an age of faith in its sublimest and noblest a
pect, an age of destruction if they would; but am
the ruins of the temples of the past he thought t
saw already laid the foundations of the great Relig
of Humanity. Then the work of the age was to
the weak, to counteract the cruel law of Nature,
only the strongest shall survive—not always, of co
the strongest in muscle and bone—the stronges
brain. An age of humanism, an age which had l
ally taken some of the sting from death, and s
of the terrors from the grave. Let them think f
moment how great were the needs of this age, w
an uprising of millions asking for mental food! T
liberated slaves of feudal ages, now happily passi
away. What a field for scattering great thoughts
What did we specially want in this age, this age
rush, and turmoil, and bustle? We wanted a pur
faith, a worthier philosophy, a higher standard
rectitude, deeper springs of conduct, more reali
less sham. Browning helped us in these aims. Lo
at the works from which quotations had been giv
—*Christmas Eve, Ferishtah's Fancies, Paracelsus*, a
Parleyings. There never was so much desire
benefit our fellow-men as at present, a feeling, it mu
be admitted, not largely the outcome of the Christia
Church, but of those who had separated themselve

n her. Not that this was the fault of the Church, the fault of those who misinterpreted and misderstood its mission. Some of the noblest minds rked for humanity outside the Church; but that s not the fault of the Gospel. Was there any etry to be got out of a consideration of the aspiras and work of the present age? Walt Whitman l there was; and whatever they thought of Walt itman as a poet—and as Browningites they must be too hard on him—he was certainly a great nker. Ruskin said we were crushing all the poetry t of the earth, but he (Dr. Berdoe) did not think With all the rush and whirl he thought there s plenty of poetry; there was poetry in the Chantunnel and the St. Gothard railway. He thought metimes, when he read *Christmas Eve*, that that ntle of Christ meant the means of locomotion at present day. As we saw more of the world, and ked with our fellow-men, we got some of our predices rubbed down, and our angles taken off. Mr. owning's teaching was, that we should get a little ore humility, and a trifle less conceit with our science. he great objection to the science of the age was its ant of reverence and love. The great teaching of aracelsus was, that neither love without knowledge, or knowledge without love will do; and the message or the age was, that with all the knowledge we had, e wanted more love to everything that breathes, hat lives and suffers. Perhaps some there would augh at Mr. Browning's views on vivisection; he lid not at all think a scientific audience would accept

Browning's teaching on that point, but let them
member that if they called him and those who h
with Mr. Browning foolish and ignorant, that Balaa
ass saw what the prophet riding upon it could
see, and they might be right after all. Religion w
Mr. Browning was put upon a basis that the inte
gent thinking people of the age could accept.
Fotheringham said, that religion is a part of the v
study of man. This paper had opened up a g
many questions for discussion. He called upon
Furnivall to continue the discussion.

THE RELIGION OF ROBERT BROWNING.

THERE is a beautiful dream-story in one of Jean Paul Richter's *Flower, Fruit, and Thorn Pieces.* A philosopher has been discussing the existence of God, and that "with as little feeling as most of us grant it." Musing on the pros and cons of the question, he falls asleep, and dreams that he awakes in a churchyard, the graves are unclosed, and shadows stalk erect through the gloom. Avalanches fall and earthquakes rend the rocks.

The great church is overthrown, and round the ruined altar the ghosts of the departed congregate in silence and awe. A lofty, sable form, having the expression of a never-ending sorrow, sinks from above upon the altar, and all the dead exclaim, "Christ! is there no God?" And he answered, "There is none!" He tells how he traversed the worlds, ascended into the suns, and flew with the milky way through the wilderness of the heavens, he gazed into the immeasurable depths of the abyss and cried,

"Father, where art Thou?" and no answ
came but from the eternal storm which no o
rules. He looked above for the Divine E
and saw but an empty, bottomless sock
Eternity lay brooding upon Chaos! The p
shadows cast themselves before the Christ; th
cry in their unutterable despair, "Jesus! h
we no Father?" and with streaming eyes
answers, "We are all orphans, I and you;
are without a Father." Are we really
orphans? Are we in very truth without
All-Father? Scientific men say we are, a
they ought to know. They have great telescop
and they look into the heavens; and they ha
powerful microscopes, and they look into t
dust; and they say He is not there. And th
are analysts, and chemists, and physiologis
and they say there is no room for God at a
and they can explain everything without Hi
We go to the top of Mount Sinai, and find
is a howling waste; and out into the lonel
deserts, and we cry aloud, and the eterna
silences are unbroken save by the voice of th
thunder, and we know all about thunder now
and no God answers us. God is not hidden i
the eternal snows nor in the clouds. The pro

ses of life and the worlds of being are daily coming easier to understand, and the verdict science is—We are all orphans! So, as there no God, there can be no religion to bind us Him, and consequently every man is a law to himself, and is only answerable to society, ich restrains him from doing that which is onvenient to his fellow-men; for the rest— drink, and be merry, for to-morrow we die! we perish as the beasts. This is what eteenth-century thought proposes to put in ce of the Churches, when they are explained t of existence, and for the old faiths when s have cast them off with other old-world erstitions. But let us see if the case is lly as bad as it appears upon the surface. Is rything gone because the first chapter of nesis is proved to be merely an allegorical em, because the Bible after all turns out to : but a collection of sacred books like any her row of ancient classics on a student's elf? Some historical, some poetical, some hical, considerably inferior to Homer, Shake-eare, and the Bhagavad-gita for practical rposes, as they tell us. Are we then to have religion, nothing to bind us to anything

higher than self, and nothing to teach our c
dren when they ask us those awkward questi
they are so apt to put? "Yes," I hear some
you say. We can make a sacred anthol
from the philosophy, the teaching of the sa
and the maxims of the wise men of all ag
these will help us to live righteously and
berly. And go back to Paganism? which s
men say was, at least in Greece, brighter
more beautiful than Christianity; but wh
divested of fine phrases and imported se
ments, we know very well, was simply the w
ship of very coarse and very sensual and
grading ideas. No; it is not so bad as t
If we fail to find God in the mountain def
or to hear Him in the voices of the thund
if we cannot search Him out with our telesco
or see Him in the atoms, there is one pla
where He will always be found, where H
whatever He be, for none can name Him, dwe
eternally—in the heart of man. Oh, students
religion, faithful seekers after truth, ponder th
when tempted to discard the Christian conce
tion of God. "The progress of reason wa
fatal only to the false gods. The true God c
the universe, the one God, whom men ador

n they do a good deed, or when they seek truth, or when they advise their fellow-men ght," says Renan, "is established for all nity."

commend to such truth-seekers the reli- n of Robert Browning, because I think s peculiarly helpful to souls in our time. n know the old philosophers said, the bane the antidote grow side by side. You fever in the tropical forests of Peru; but bark which cures it is found hard by the er spots. Now, it is always thus with spe- ations and destructive criticisms in all great es of thought. It can only be the false ch perishes; the good must be eternal. It ood that we have lost so much of the vin- ive theology of the past. It is good that fogs are dispelled which hid so long from us r Father's face; good that we are beginning see that Brummagem theologians have only st the gods which they made in their own orkshops, and that the God of nature, the od which dwells in the human heart, the pirit of God, the Soul of the world, is reigning nd ruling and loving still. In Robert Brown- ng we are introduced to a religion which is not

a sectarian religion, is not a professional
mula, but is just the reasonable belief of a g
English nineteenth-century thinker, who i
sympathy with all the science and progress
mental activity and inquiry of our day.
have outgrown some of our false concept
about God, you know; the crude notions a
the Deity formed when man first emerged f
a state of savagery will not do for the me
to-day. Not that God alters, but our con
tions of Him must grow with the expan
of our own minds. Robert Browning is
aged man, but still full of life and vigour,
I venture to say the greatest philosoph
thinker living. He has been writing poems
over fifty years, and men are just beginnin
read and value them. It is the stupid fas
to pretend that he is difficult to understa
Well, perhaps if we only bring to the task
amount of brain necessary to enjoy an ordin
novel with, he may be unintelligible; but as
deals with deep subjects he demands true stu
Now he has formed certain definite convictio
about God, the soul, and the future state wh
he holds very firmly, and which are good for
to weigh well, because they come from a thinke

an explorer into the dark recesses of the human soul, and who is entitled to speak to us in the name of the science of our day, for he is fully conversant with it. What does he say about God, a supreme Being who is over Nature and pervading her throughout? Well, for one thing, he thinks that—

> "God dwells in all,
> From life's minute beginnings up at last
> To man."

All nature to Browning is viewed as a thought of God. "God is the perfect Poet," he says, "who in His Person acts His own creations." So the whole universe is a crystallized thought of God to him. Within the past few years philosophers have told us a great deal more about the atoms and molecules than we ever knew before; and the infinitely little has now become to its students the awful and incomprehensible. These atoms are "the foundation stones of the material universe, which, amid the wreck of composite matter, remain unbroken and unworn." Of the atoms, Professor Tyndall, who knows more about them than perhaps anybody else, says, "they are so small, and, when grouped to molecules, are so tightly clasped to-

gether, that they are capable of tremors equal in rapidity to those of light and radiant heat"; "They can vibrate to and fro millions of millions of times in a second." Knowing all this, what does Browning say? He says,—

> "The small becomes the dreadful and immense."
>
> "We find great things are made of little things;
> And little things go lessening, till at last
> Comes God behind them."

Talk about understanding nature, common-sense science, and all the rest of it! Professor Tyndall, whom men call an atheist, says on this, "I should be inclined to ascribe the creation of the world of molecules to inspiration, rather than to what is known as common sense."

When you want to reach the limits of the understanding, do not take a telescope, and try to penetrate the infinite distances of the stars. Think of the eternal dance of the atoms that never grow old, and which never tire. Think how they may "despise" us, as the poet says.

"I am a materialist," said one to me the other day."

"Oh! are you?" I said. "Then tell me all about the atoms."

he name," says Browning,

> "comes close
> Behind a stomach-cyst, the smallest
> Of creations,"

ng to the fact that, with all our physi- and our chemistry, we have not, in the least, bridged the infinite gulf which tes living from not-living matter. We far off as ever from understanding how owest form of organic life is generated inorganic matter.

he undevout astronomer is mad." What say to the scoffer and the flippant in the e of the atoms? When Mr. Browning of the human heart with all its noble and us impulses, of the mother's love, and rtyr's heroism, he does not think of the ons and thrills of so much matter. To s Carlyle said of Frederick the Great, as flatly inconceivable that intellect and emotion could have been put into him entity that had none of its own."

! He says,—

> I knowledge? Confounded, it shrivels at wisdom laid bare.
> e I forethought? How purblind, how blank to the infinite care!"

"God is seen
In the star, in the stone, in the flesh, in the soul,
clod.
And then looking within and around me, I ever rene
(With that stoop of the soul which, in bending, u
it too),
The submission of man's nothing-perfect to God
complete,
As by each new obeisance in spirit, I climb to His

Now, as we can question about all thi
get our answer, Mr. Browning says,—

"Question, answer, presup
Two points: that the thing itself which questions, ans
is, it knows,
As it also knows the thing perceived outside itself—
Actual ere its own beginning, operative through its
Unaffected by its end—that this thing likewise ne
be.
Call this—God, then, call that—soul, and both—
facts for me.
Prove them facts? That they o'erpass my power
ing, proves them such." La Saussaye

So we see that Mr. Browning may b
described in two of his own lines,—

"Crowned by prose and verse, and wielding wit
bauble, Learning's rod,
He at least believes in soul, and is very sure of Go

Oh! but, you say, what sort of a God?
Martineau has beautifully spoken of the G

he believes as "the Mind that meditates
uty and speaks in law." Do not you think
ently reasonable that the universe should
mind? Its order is so perfect, that if
e no God, no central, guiding Spirit, we
nfronted by a vastly greater difficulty
hat presented by the orthodox concep-
the order of the universe. But you say,
n I look around me, and see all the evil,
, and brutality in the world, what con-
n is there in telling me about its Creator,
t be to make me hate Him?" Because,
is omnipotent, He could stop all this
a word. I shall let Mr. Browning
you. Our poet is, I think, extremely
with his problem of evil in the world.
evidently of that school of philosophy
s the Mystics; and it is pretty certain
ch of the mysticism pervading European
s thought had its origin in Buddhism.
ke the Bhagavad-gita, that beautiful old
book of philosophy, and compare it with
s à Kempis's *Imitation of Christ*, we
fail to be struck by their similarity. To
extent we owe some of our best religious
ht to Buddhism will never be known, but

it is certain that Mr. Browning has abs
some of its teaching. Take his view of th
in the world. He says, in that wonderfu
of his which I commend heartily to ever
of music, the poem called *Abt Vogler*—

"There shall never be one lost good! What was, s
as before;
The evil is null, is nought, is silence implying s
What was good, shall be good, with, for evil, so mu
more;
On the earth the broken arcs; in the heaven, a
round."

The Buddhist, the Mystic, and the Ch
philosophers alike agree in denying the
of evil, and affirming the reality and
nence of good. The direct tendency of
is to perish, of all good to become perm
Walt Whitman beautifully expresses thi
says: "Roaming in thought over the u
I saw the little that is Good steadily ha
towards immortality, and the vast all

he moral qualities of man—
o make him love and be beloved,
eating and self-sacrificing too,
enable man to wring, from out all pain,
pleasure for a common heritage."

ese things then man is compelled to which means, in man, as good as reach l."

ou see that Mr. Browning is what we optimist. Another article of his religion ef in the immortality of the soul, because s not here complete. Everything else is lete except man. Has man been developed

from the lower animals? The Poet do doubt it. Nevertheless he is now—

> "a man
> For aye removed from the developed brute,
> A god, though in the germ."

He is not complete yet; "man is no as yet." His end, he says, is not attained only here and there a star shines out to the darkness, a Shakespeare here, a M there, a Socrates and a Plato in one age, Bacon and a Dante in other ages. The will come when God will make no more g but elevate the race at once! Completio perfection are for star-fishes; you will see a better star-fish than you can pick Brighton beach to-day.

> "Let the mere star-fish in his vault
> Crawl in a wash of weed, indeed,
> Rose-jacinth to the finger-tips;
> He, whole in body and soul, outstrips
> Man, found with either in default.
> But what's whole, can increase no more."

> "Progress is man's distinctive mark alone,
> Not God's and not the beast's. God is, they a
> Man partly is and wholly hopes to be."

Man has been and is so great that he

ospect of his stopping in his development, n his very greatness sees the promise of er things to come.

"I know this earth is not my sphere,
For I cannot so narrow me, but that
I still exceed it."

mark that, in insisting upon the reason- ess of the immortality of the soul, Mr. ning does not place it on the low orthodox d which used to be held, that this life othing but a poor, wretched pilgrimage to hing better. The waste, howling wilder- he old hymn speaks of, where the only g is made by the miserable, small-souled s themselves, finds no place in Mr. ing's system. Boldly and clearly he out on this point in the fine lines—

"Another world!
d why this world, this common world to be
make-shift, a mere foil how fair soever
o some fine life to come?"

a school, as a gymnasium, he will bate g of the value of this life; but a future e thinks is indicated by man's longing for anence, his manifest incompleteness here. l through the poet's work, from first to

last, the belief in personal immortalit
reasonable grounds, is a main article
creed. In this tabernacle life we were m
grow; and the "broken arcs" of life d
something beyond, complementary to our
vision of the future. In all evil there is
thing remedial, something conservative
suffering. There are worse things than l
to live on sixpence a day and earning it.
great argument for immortality, is not for re
but because it is *reasonable.* This life is f
short in which to do all we want. W
catch a few notes of the song, and it m
completed elsewhere. And this belief
unscientific. It is the fashion to call it
scientific." Physiology has not helped
least iota to explain how it was that b
beer made Hamlet's soliloquy. The
theory did *not help us a bit; therefo*
not unscientific to hold to a future life.
Browning it is a *hope,* neither more no
but still a hope.

This is a grand thing, coming from so
a genius of the Anglo-Saxon race—a
replete with the sciences and arts, and of
found learning and research. When such a

said there is hope for a future life, it is a infinitely comforting to lesser souls who oked forward with a little hope.

w these reasonable beliefs are drawn, ill perceive, not from the Bible, not from ithority of the Christian or any other h, but from the indications of a calm beral philosophy. Mr. Browning does espise any man's creed or his no-creed; if honest and sincere, it is so far good. He wonderful poem termed *Christmas Eve*. n goes into a miserable little Metho- apel on Christmas Eve, and sits there falls asleep trying to listen to a vulgar on the birth of Christ. As he sleeps ams of the various forms of Christianity. cies that he has left the chapel and gone the stormy night. And, lo! a great happens to him: he thinks he sees splendour of the lunar rainbow the f Christ, who has been present at that apel. The face of the Master turns s him rather reproachfully, and in a t he is caught up in His vesture and away to St. Peter's at Rome, there to another and a far grander form of

worship on that same Christmas Eve. Master enters, for amid all the media there was truth there also. There we love and faith which had made Christian out of heathen lands, and softened th hearts of savage men. But faith an were not all, and the Master wraps him mantle once more, to find intellect and ledge; and soon they enter the lecture a German university, where a professor i coursing on the Christ-myth.

He refuses to enter here, but Chris within. There must then be truth her and so there is. The professor has pul the faith very, very fine indeed; by his tests he has reduced the pearl of grea to ashes, "and yet in his judgment l pearl." He bids his followers treasure precious dust, by no means throw a away. Call it a toy if they will; it wi a good purpose. There is something o after all in the beautiful thing he has des

And so they leave the German pr and the traveller is caught up again folds of the vesture of Christ, and he back to the little chapel whence he

e says, he sees his error now; he has d the poor worship for its vulgarity. ger, however, will he reject the water of sake of the coarseness of the vessel out ch he has to drink it.

ow no teaching which is more thoroughly ful and wholesome than Browning's. is none of that almost infernal, deadly ation and insensibility to pain or pleasure we see in Buddhist philosophy. He the pleasures and the ills of life as he hem, and is cheerful and philosophical all.

God in which some find it so hard to is often but a caricature of God of which ve somehow got hold. We all believe e, mercy, and truth, which are the very God's being. These things to Brown- *God.* He tells us "we must correct ait by the living face. Man's God, by God in the mind of man" (*The Pope*,

annot expect to understand God, as p Blougram says :—

ith, indeed—you know not what you ask !
belief in God the Omnipotent,

Omniscient, Omnipresent, sears too much
The sense of conscious creatures to be borne.
It were the seeing Him, no flesh shall dare.
Some think, creation's meant to show Him for
I say, it's meant to hide Him all it can ;
And that's what all the blessed evil's for.
Its use in time is to environ us,
Our breath, our drop of dew, with shield enou
Against that sight, till we can bear its stress.
Under a vertical sun, the exposed brain
And lidless eye and disimprisoned heart,
Less certainly would wither up at once,
Than mind confronted with the truth of Him.
But time and earth case-harden us to live ;
The feeblest sense is trusted most ; the child
Feels God a moment, ichors o'er the place,
Plays on, and grows to be a man like us."

He has written a very curious poe

t work, neither shall he eat." Nature
to say, If he will not work, he shall not
all; certainly not without retrogression
nost degraded of types.

ning says:—

"And so I live, you see,
Go through the world, try, prove, reject,
Prefer, still struggling to effect
My warfare; happy that I can
Be crossed and thwarted as a man,
Not left in God's contempt apart,
With ghastly smooth life, dead at heart,
ame in earth's paddock as her prize"

. . . .

in,—

Learning anew the use of soldiership,
Self-abnegation, freedom from all fear,
Loyalty to the life's end! Ruminate,

Deserve the initiatory spasm,—once m
Work, be unhappy but bear life, my
Ring and Book,

Be faithful, says our Mr. Greathe

"Thus at first prompting of what I call God,
And fools call Nature, didst hear, comprehe
Accept the obligation laid on thee

. . . .

As brute and bird do, reptile and the fly,
Ay and, I nothing doubt, even tree, shrub,
And flower o' the field, all in a common pa
To worthily defend the trust of trusts,
Life from the Ever Living."
Ring and Book, vol. iv.

No whining about life not being living here, because of the inevitable t must encounter. No!

"For mankind springs salvation by each hindra
posed."
Sordell

"Do something," says Carlyle, in t strain:—

"Be no longer a chaos, but a Wo a Worldkin, Produce! Produce! the pitifullest infinitesimal fraction of a produce it, in God's name!"

He does not say, with Tennyson:—

"Oh yet we trust that *somehow* good
Will be the final goal of ill,
To pangs of nature, sins of will,
Defects of doubt, and taints of blood;

That nothing walks with aimless feet;
That not one life shall be destroy'd,
Or cast as rubbish to the void,
When God hath made the pile complete."

No; beautiful as this faith is, Browning's is stronger and his vision clearer. With him is no *somehow;* but he shows us just how the ill tends to good, and we have not to wait till the pile is completed; but we see the Builder at work, putting into His fabric the unlikely looking "rubbish" we too rashly thought would be cast aside.

I say, with all deference to those who know Mr. Browning's works better than I do, that it appears to me we cannot properly understand them till we clearly recognise what is the poet's "Estimate of Life." I think that estimate is *unique*, that it is eminently *scientific*, and that it is pre-eminently *good* for us to recognise. I should say that the theme, as musicians call it, of all our poet's work is—*that no factors in our life* (however unpromising they may appear)

can be spared consistently with our development and progress.

He does not complain with Dryden, that "Life is all a cheat," nor ask plaintively with Gay, "Oh, what is life with ills encompassed round?" He laments not with Shakespeare that "Life's but a walking shadow—a tale told by an idiot, full of sound and fury signifying nothing"; nor with that other who said, "Life is a weary interlude that leaves no epilogue but death"; nor with him who grieved, "The longer life, the greater choice of evil." He calls it not "a mist," "a riddle," "a shadow," "a wind-swept meadow." Nothing of all this in Browning; with him, as in *Fra Lippo*,—

"The world and life's too big to pass for a dream."

As in *Saul*,—

"How good is man's life, the mere living! how fit to employ
All the heart and the soul and the senses for ever in joy!"

'I have lived, seen God's hand thro' a lifetime, and all was for best!"

As in *Rabbi Ben Ezra*,—

"Perfect I call Thy plan;
Thanks that I was a man;"

As once more in *Fra Lippo Lippi*,—

"This world's no blot for us
Nor blank; it means intensely, and means good."

And as again in *The Guardian Angel*,—

"O world, as God has made it! All is beauty:
And knowing this is love, and love is duty."

He goes to the Morgue, and even there, contemplating the corpses of the poor wretches on the slabs, can exclaim with his beautiful, healthy optimism,—

"My own hope is, a sun will pierce
The thickest cloud earth ever stretched;
That, after Last, returns the First,
Though a wide compass round be fetched;
That what began best can't end worst,
Nor what God blessed once prove accurst."

And in that magnificent *Abt Vogler* poem,—

"There shall never be one lost good! What was shall
live as before;
The evil is null, is nought, is silence implying sound;
What was good, shall be good, with, for evil, so much
good more;
On the earth the broken arcs; in the heaven, a perfect
round."

The *In Memoriam* utterances sound like

the voice of Mr. Little-Faith, after listening to such a defiance of evil as this.

From *Pauline* (Mr. Browning's first poem, written, I may add, for the benefit of those who may not know the order of his works, in 1832, when he was but twenty), where he says :—

> "Feeling God loves us, and that all that errs
> Is a strange dream which death will dissipate"—

through the splendid triumphs of his genius—*Paracelsus*, *Sordello*, *Men and Women*, *Fifine*, down to his last work, we have the same undiminished, nay, accentuated, confidence that "the soul, stung to strength through weakness, strives for good through evil," because "Law deals the same with soul and body"; and I say that such a long life of consistent facing the ills of time, with confidence that "God's in His heaven, all's right with the world"—while the limp, degenerate jelly-fish who prate about life not being worth living, and, because they are emasculate and jaundiced, dare to tell us, with their poisoned melancholy, that life is a long mistake—entitles Mr. Browning to a perfectly unique position among the prophets of our day : and because I believe him to occupy this place

in literature, I have taken leave to term him a scientific poet, a thesis I am still prepared to maintain. And for this reason, that he recognises the great Darwinian truth that opposition and struggle are the great factors in development and progress; that as with the organs of animals and plants, which are the outcome of their necessity, so with our souls, in the words of Dewey: "Human virtue is the result of effort and patience in the circumstances that most directly try it. All wisdom and worth in the world are a struggle with ignorance, infirmity, and temptation; there is not an admirable character presented before you but it has cost years and years of toil, and watching, and self-government to form it." The struggles of orchids to secure cross fertilization have evolved their rich, beautiful forms; and our own struggle after good serves to evolve our noblest faculties.

"Our business with the sea
Is not with air, but o' the water, watery:
We must endure the false, no particle of which
Do we acquaint us with, but up we mount a pitch
Above it, find our head reach truth, while hands explore
The false below."

Fifine at the Fair.

He despises not the grosser element; "he moves in it, yet resists; is upborne on every side by what he beats against"; "The prize is in the process."

This doctrine runs through all his work as a vein of gold, not merely shining here and there, but running as a clue to his teaching throughout; and if this is not in the methods of science, so much the worse for science.

Then again, the true scientific mind never loses sight of the smallest fact which can throw any light on the subject of investigation. Mr. Browning is remarkable for never ignoring the apparently insignificant factors in the life-history of his characters. He deals with the whole of these factors, not with a part only, as do so many writers. He must have everything before he will construct his parallelogram of forces.

> "Oh, the little more, and how much it is!
> And the little less, and what worlds away!"
> *By the Fireside.*

Now it is a scientific truism, that it is the little overlooked forces ever at work which are always changing the face of our world. The present age has learned to write the epic of the

worm; we are beginning to duly estimate the value of the infinitely little. And not less true is it that our mental development depends on a number of circumstances which we are too apt to overlook. It has recently been discovered that Mr. Darwin, careful as he always seemed in allowing for the fullest importance of minutest causes, made a great mistake in his account of the origin of the coral reefs in the Pacific; it has been urged that he did not make nearly sufficient allowance for the effects of those trifling causes, and attributed the origin of these coral islands to forces which it has been shown have had much less to do with them than he supposed—the fact being that apparently the most unlikely things had far the most work to do.*

So is it with our own lives and characters; it is the unceasing play of mean and paltry things which mould them. Browning is always insisting on the value of these trifles. We neither become angels nor devils all at once.

* This was written before Mr. Huxley's reply to the Duke of Argyll in the *Nineteenth Century* appeared. Whether Darwin was right or wrong has not yet been decided, but the illustration will still serve.

Our poet is always taking us behind the scenes and showing us his characters preparing for the parts they play. He points out just where the paint and the padding come in. He is as merciless with his heroes and heroines as the valet to his master; but that is because he knows them as intimately.

Now all this is healthy and pre-eminently useful, as we said at the outset. It is well to know that "the laughing loves" at the base of the cup are not more valued in the Master's eye than "the skull things in order grim" about its rim. We are not to look "down but up! to uses of a cup."

> "What I aspired to be,
> And was not, comforts me:"

> "'Tis not what man Does, but what man Would do, which exalts him."

Though we cannot bring the sum right, Browning always gives us credit for the working. He judges never by the world's standard of success or failure, and is always putting down the mighty from their seats and exalting the humble and the meek.

Do we succeed? It is due to "just this or

that poor impulse, which for once had play unstifled."—*Cristina.*

Do we fail? though we tried so hard—

"That low man seeks a little thing to do,
Sees it and does it:
This high man, with a great thing to pursue,
Dies ere he knows it.

That low man goes on adding one to one,
His hundred's soon hit:
This high man, aiming at a million,
Misses an unit.
That, has the world here—should he need the next,
Let the world mind him!
This, throws himself on God, and unperplexed
Seeking shall find him."

A Grammarian's Funeral.

"Better have failed in the high aim, as I,
Than vulgarly in the low aim succeed
As, God be thanked, I do not!"

The Inn Album.

"There is Heaven, since there is Heaven's simulation—
Earth:
I sit possessed in patience: prison roof
Shall break one day and Heaven beam overhead."

All this sympathy with failure is so helpful to the poor handicapped ones who are always being pushed aside in life's race. I shall be told, I suppose, that this proves Browning to

be unscientific—that the survival of the fittest theory does not provide for the failures.

> " A tree born to erectness of bole,
> Palm or plane or pine, we laud if lofty, columnar—
> Little if athwart, askew,—leave to the axe and the flame !
> Where is the vision may penetrate earth and beholding acknowledge
> Just one pebble at root ruined the straightness of stem ?
> Whose fine vigilance follows the sapling, accounts for the failure,—
> Here blew wind, so it bent : there the snow lodged, so it broke ? "
>
> *Ixion.*

But the whole business of modern science is just now devoted to getting rid of the pebbles at our roots and propping up our weakly boles. The failures were never so well looked after as now. For though "all's Law, yet all's Love" too, thank God. We have said little of Love in all this argument, not because there is little of it in Browning; it is the dominant note of his work—

> " As some imperial chord subsists,
> Steadily underlies the accidental mists
> Of music springing thence, that run their mazy race
> Around."
>
> *Fifine.*

BROWNING AS A SCIENTIFIC POET.

THE commonly accepted notion of poets and poetry excludes the idea of the scientific habit of thought, and still more of its expression. We expect the poet to speak to us, in metrical language, of the passions and interests of man, and to interpret for us the voice of nature in strains that are not hampered by exactitude and precision. In other words, we grant him "the poet's licence." But as all this is just the opposite to our demands on the man of science, it seems a contradiction in terms to speak of a scientific poet. It jars upon our ideas of the fitness of things. But why? Because they are conventional ideas; and our notions of poets and what constitutes true poetry, are not always inspired by familiarity with the greatest masters of the art. The scientific method, it is true, is not in favour with the minor poets; and it is not given even to all the greater to combine with the highest poetic faculty the deeper insight into the hidden things of nature possessed by

Robert Browning. In him, as I hope to show, the poetic and scientific methods are not merely found together, but are truly combined; and throughout his works are scattered abundant evidence that he, with keen vision, has seen far into the workings of Nature, and ennobled his phrase and verse from the study of her phenomena.

Milton has done this too; and Tennyson has proved that the scientific spirit can enrich his verse, and that he, in turn, can invest the operations of natural laws with the enchantment of his art. Who could have imagined that a poet would have stated the atomic theory of Lucretius in the magnificent terms that he has done?—

> "A void was made in Nature; all her bonds
> Cracked; and I saw the flaring atom-streams
> And torrents of her myriad universe,
> Ruining along the illimitable inane,
> Fly on, to clash together again, and make
> Another and another frame of things
> For ever."

As a specimen of Tennyson's poetry, I don't think any one can say it is spoiled by being a statement, and an accurate one, of the atomic theory.

And if for Browning it be true that—

> "Verse was a temple-worship vague and vast,
> A ceremony that withdrew the last
> Opposing bolt, looped back the lingering veil
> Which hid the holy place,"
>
> (*Pauline,*)

what wonder if he speak of the deepest things the holy place enshrines in the sacred language that befits its service?

It would probably not add to Mr. Browning's popularity were the world convinced of his advanced standpoint. It is not apt to love overmuch to be taken out of its depth; it likes its poets to sing as caged birds are taught to warble—songs piped by itself, and demands of its Sordellos that they shall be bards and not philosophers:

> "Why introduce crotchets like these? fine surely, but no use
> In poetry—which still must be, to strike,
> Based upon common sense; there's nothing like
> Appealing to our nature.
> . . . . . .
> Would you have your songs endure?
> Build on the human heart."
>
> *Sordello.*

Apart from the fact that we are not accustomed to find the poetic and scientific natures

co-exist, there seems a tacit understanding that it is somehow an offence (even when they do) if the poet trench on the other's province. In a humorous letter to the *Pall Mall Gazette* the other day, on the question whether a certain flower of delicious odour should be called "tube-rose" or "tuber-rose," the writer says that he is "deeply distressed to hear that *tube-rose* is so called from its being a 'lumpy flower.' It is not at all lumpy, and even if it were, no poet should be heartless enough to say so. Henceforth there really must be two derivations for every word, one for the poet, and one for the scientist. And in the present case the poet will dwell on the tiny trumpets of ivory into which the white flower breaks, and leave to the man of science horrid allusions to its supposed lumpiness, and indiscreet revelations of its private life below ground. In fact, tuber as a derivation is disgraceful. On the roots of verbs philology may be allowed to speak, but on the roots of flowers she must keep silence. We cannot allow her to dig up Parnassus."

Darwin's investigations into the fertilization of plants, and the part which their colours and

forms play in that process, must have been felt by poets of the lower school as almost an outrage; yet to a Browning these discoveries serve only to awaken ideas and set up trains of thought of infinitely more value,—as being in harmony with the spirit of nature,—than they could have ever imagined who only thought of the redness of the rose and the blueness of the violet as adjuncts with the graces of their form to make the fields and woods look pretty.

He is in sympathy with those who can tell us what is the hidden meaning of the "objects that throng our youth." "We see and hear, and do not wonder much."

> "As German Bœhme never cared for plants
> Until it happed, a-walking in the fields,
> He noticed all at once that plants could speak,
> Nay, turned with loosened tongue to talk with him.
> That day the daisy had an eye indeed—
> Colloquized with the cowslip on such themes!"
>
> *Poems*, vol. v., p. 208.

It is not demanded of the poet that he should ignore the beauty of the rainbow till he has studied Fraunhofer's lines. What we do say is, that neither the scientist alone nor the poet alone comprehend Nature till they borrow from each other—the one the reverence and

the worship, the other the learning and loving study, that, united, make up the true spirit in which she is to be approached. In Robert Browning there is the happiest combination of these requisites.

He has learned with delight how the human brain enshrines its mysteries in its myriad cells, where thought is born and memory treasures her precious records; of the marvellous mechanism of our limbs, with their cords and pulleys, and facile play; of the eye, that with insatiable activity supplies the brain with its impressions of the world around us; of the musical instrument of ten thousand strings, played on by the air-pulsations that arouse the sense of hearing to activity every moment of our waking lives.

In a very beautiful passage in *Ferishtah* (p. 76) he makes the Creator address man thus—

> "Wherefore did I contrive for thee that ear
> Hungry for music, and direct thine eye
> To where I hold a seven-stringed instrument,
> Unless I meant thee to beseech Me play?"

Here, of course, the reference is to the organ of Corti in the internal ear, with its 3,000

arches, its keys ranged like those of a piano, aptly described by the poet as "hungry for music." The seven-stringed instrument, I need not say, is light and the seven colours of the spectrum.

It is nothing wonderful that he should know such easily-acquired facts; it *is* wonderful that they should be transfigured by the magic of his art. Yet he imparts his secret to the attentive reader. It is his deep love of the law and harmony of nature. His process has been that which Henry Taylor describes as his own: "Observation of facts; generalization from facts observed; rejection into the concrete, but with improvements from the fancy, of the general conclusions obtained."

The more thoroughly the lover of Nature is skilled in the knowledge of her laws, the greater will be the intellectual pleasure with which he will contemplate them; and the poet who can follow Nature into her secret chambers, and commune with her on her deepest phenomena, will be the poet who has the noblest things to say to the human soul. The poet who can interpret for us the "great symphony of organic harmony composed in the forest key," as Mr.

Mivart terms it, speaking of the vegetable world of the Brazils—of the recently-discovered harmonious relations of the ocean and its submerged wealth of wondrous beauty, will be the poet of the future who will come into a closer relationship with man than has ever been reached before. So far from the fascination of Nature being dispelled by our completer knowledge of her laws, it has been a hundredfold increased by the revelation of glories before undreamed of, which are none the less resplendent because we know their origin. How science and poetry can blend in one harmonious spirit, students of Henry Thoreau need not be told.

By science in this connection I do not mean merely mental science, without which a poet could not hope "to loop back the veil." We know how versed in this was Shakespeare. Coleridge speaks of "Shakespeare's deep and accurate science in mental philosophy." No one will deny, I presume, this characteristic to Robert Browning; but I claim something more than this for him. I maintain that in his works he exhibits a deep and earnest sympathy with all branches of human knowledge dealing with

the causes and connections of natural phenomena—in other words, with what we term the physical sciences. Now this is essentially an age pre-eminent for the investigation of such causes and connections; yet I think we may say that in its atmosphere there is nothing that need stunt and dwarf the spirit of poetry. I do not quite see with Mr. Radford, in his remarks on Mr. Bury's paper, "that the language of poetry and science are diametrically opposed." They need not use the same language of course; but I can see no reason for opposition between the spirit of poetry and that of science. Poetry and the physical sciences flourished together in the Greek intellect; and though perhaps, as far as modern times are concerned, till the advent of Haller and Goethe, the scientific and the poetic minds had not been blended, we have in Goethe a grand example of the genus; and in Browning, as I think, we have the noble forerunner of a new, strong race of poets of the first order, the interpreters of the inquiring, analytical soul of the age, in which no subject is too sacred to be questioned. No; were the physical sciences, like our factory chimneys, to exhale a breath poisonous to the surrounding

flora of the poet's fancy, as some have thought, we should be terrible losers by all our advancement in the productive arts, and Mr. Ruskin's lament over our decadence be more than justified. The spirit of the age has dissolved the legend of William Tell, and taken some of the romance out of the Tell country; but it has given it a magnificent railway, which in a few hours brings the flowers and fruits of Italy to cheerless London slums.

The poet of the future will see more romance in that fact than in many time-honoured legends. He will have to sing to us of the modern Spirit of the Alps—Professor Tyndall, in his chalet, questioning the rainbow, the glacier, the avalanche, and the mountain mist and storm. The dragons are gone, and the knights that slew them live only in legendary tales; but the epidemiologist, in his laboratory, doing battle with the germs of cholera and typhus, is a not less noble theme for the poet of the nineteenth century, though an artist might not think the subject would look so well on his canvas. It was a poet, Lucretius, who eighteen hundred years ago anticipated the atomic theory. We owe him a debt of gratitude for proving in his

own person that poetry is not incompatible with science, and that it is quite possible for a man to investigate the laws of nature without blinding his vision to the loveliness of the ideal world. He sang the reign of law in the universe, that our misery or our happiness was not dependent on the caprice of the gods, but on the nature of things. This man was the true poet, *the creator;* and it has taken the world eighteen centuries to prove as facts what his prophetic spirit foresaw. We live now in an age of technical accuracy. The time of the poet's licence is past; and poetry, if not now scientifically accurate, is to us of this age foolishness. Some one has said that a poet who was not mad was no poet at all. If Mr. Browning has any madness, it is in his method, never in his matter. His is emphatically the sound mind in the sound body; he is the poet of downright common sense; his imagination never runs away with him, though possibly it is exhausted in his style. Scientific students of Browning must often think what a scientist he would have made, just as readers of Professor Tyndall are always exclaiming, "Here is the poet of science!" Hear what he himself

says of the experimental philosopher: "He lives a life of the senses, using his hands, eyes, and ears in his experiments, but is constantly being carried beyond the margin of the senses. His mind must realize the subsensible world, and possess a pictorial power; if the picture so formed be correct, the phenomena he is investigating are accounted for. Imagination with him does not sever itself from the world of fact; this is the storehouse from which all its pictures are drawn; and the magic of its art consists, not in creating things anew, but in so changing the magnitude, position, and other relations of sensible things as to fit them for the requirements of the intellect in the subsensible world." Poets have been allowed to exercise a riotous power in dealing capriciously with facts. But if a well-ordered and disciplined scientific method restrain this riot and caprice, I don't think the result is any the less true poetry. Perhaps the fact that Browning is restrained by his science from playing havoc with phenomena may account for the *un*restrained riot and caprice of his words. On Tyndall's theory this may really be Browning's safety-valve.

Christopher North and the Ettrick Shepherd in the twenty-second of the *Noctes Ambrosianæ* so exactly and admirably place the question in its proper light, that I may be pardoned if I quote a few sentences.

The Shepherd asks, "What think ye, sir, o' the dogma, that high imagination is incompatible wi' high intellect, and that as science flourishes poetry decays?"

North replies, "The dogmata of dunces are beyond the reach of redemption. A man may have a high intellect with little or no imagination; but he cannot have a high imagination with little or no intellect. The intellect of Homer, Dante, Milton, or Shakespeare, was higher than that of Aristotle, Newton, and Bacon. When elevated by feeling into imagination, their intellect becomes transcendent, and thus were they poets, the noblest name by far and away that belongs to any of the children of men. What is science? True knowledge of mind and matter, as far as it is permitted to us to know anything truly of the world without and the world within us, congenial in their co-existence. What is poetry? The true exhibition in musical and metrical speech

of the thoughts of humanity when coloured by its feelings throughout the whole range of the physical, moral, intellectual, and spiritual regions of its being. Poetry and science are identical —or rather, that as imagination is the highest kind of intellect, so poetry is the highest kind of science. It is only in an age of science that anything worthy the name of poetry can exist. In a rude age there may be bursts of passion—of imagination even, which, if you insist on calling them poetry, I am willing so to designate; in that case, almost all human language is poetry. Will any antiquary or archæologist show me a bit of poetry as broad as the palm of my hand worth the toss up of a tinker's farthing the produce of uncivilized man? Not till man and nature and human life lie in the last light of science—that is, of knowledge and of truth—will poetry reach the acme of its triumph. As Campbell sings,—

> "'Come, bright Improvement, on the car of Time,
> And rule the spacious world from clime to clime,'—

and still poetry will be here below Prime Minister and High Priest of Nature."

People say that when we have solved all the

mysteries of Nature, the sentiment will be all gone and poetry die out, and therefore the phrase "scientific poet" is a contradiction in terms. The cynical philosopher who, when his wife cried for the first time in his presence with the hope of softening his heart in the direction of a milliner's bill, assured her that tears would not move him in the least, as he knew their exact constituents, and was not going to waste his money on account of an exhibition of a solution of phosphate and muriate of soda—though probably a good chemist had not enough intellect to raise him to poetry; and there is no reason to suppose that the knowledge that lightning is electricity will destroy the grandeur of an Alpine storm, or that cloud-forms, the play of light and colour on a mountain side, or the dew-drops on a leaf, will cease to be poetical because their causes are well understood. The tear-drops in the eye of a beautiful woman will surely not be less beautiful because we are "familiarly acquainted with the perfected philosophy of all secretions."

Now it is because, from a careful study of Mr. Browning's works, I have come to the

conclusion that the poet is intimately acquainted with the physical sciences, that I hold him to be for this very reason so much the more a great poet—the greatest living poet; he can touch us the closer because he knows more about us than we know ourselves, more about our environments, more about the phenomena that encircle our lives. We yield ourselves up to him; our secret thoughts are not hid from him; he knows our anatomy to the backbone. It is his character of all-roundness that makes him excel. He knows everything; if we can't understand him, it is because we know so much less than he. He is always right. Often he appears unintelligible. One ransacks dictionaries and encyclopædias; it is they that are defective, not Browning wanting. And all this amazing wealth of learning sits so easily on him that he wears it as if he had been born in it, and, to me, at least, he never appears pedantic. Are you a lawyer? he talks to you as if he had been all his life in the long robe; a physician? you never had a professor of medicine so close at your heart as Paracelsus; a theologian? he has all the wisdom of the Schoolmen and the love of John himself; and

so with all his students he is in closer touch than any other poet since Shakespeare the divine. The artist loves him as a brother of the pencil, the musician claims him of his kin, and the scientist, opening his works where he will, sees in every line intimations that here is the master of all others who can hold council with him on equal terms, and finds in him a brother to rejoice with him and "triumph o'er each secret wrung from Nature's cold reserve." This is an immense claim to make, but it can be sustained; and its very immensity serves to explain the slow but steady progress our poet has made past all lower niches towards the highest seats where the gods are.

Carlyle demanded of a truly great man that he must be all sorts of men, and had little respect for "poets who could only sit on chairs and compose stanzas"—Browning must have gone to his heart. Not in the sense satirized in "the Loves of the triangles" or "the Loves of the plants" is our poet all this to us, but in the fact that he has so largely imbibed and assimilated the science of the time that almost every page of his works is permeated by its influence. Sometimes this is shown by a word

or two that passes unnoticed by a reader who is not familiar with the ideas the word calls up, as, for instance, in the lines :—

"The child feels God a moment,
Ichors o'er the place, plays on, and grows to be a man like us."

In the expression "ichors o'er the place" is found a beautiful illustration from the physiology of repair in injured skin surfaces and the pathology of wounds. As the cicatrix closes up the cut flesh, so does the child's mind become case-hardened after the first effects of the awfulness of the Infinite One's apprehended presence have passed away. The time soon comes when "God is not in all his thoughts."

In some cases we have an actual statement of a scientific truth in so many words, as in *Sordello* :—

"A soul—above his soul
Power to uplift his power,—this moon's control
Over the sea depths." P. 187.

And again :—

"Wherefore doubt
That love meet for such strength, some moon without
Would match his sea?"

P. 189.

Sometimes he is actually technical, as in some lines of *Prince Hohenstiel Schwangau* (p. 45) :—

> "Try to make good do good as evil does—
> Were just as if a chemist, wanting white,
> And knowing black ingredients bred the dye,
> Insisted these too should be white forsooth."

His optimism is always cropping up ; and it is not surprising he should cull illustrations from chemistry, which abounds in examples of good and beautiful things produced from worthless and ugly substances. The lovely series of aniline dyes made from coal tar, for instance, might surely afford a scientific poet of an optimistic turn of mind some help in this direction. In the lines just quoted the idea, that to get the highest good we must have some evil amongst the ingredients, is not elaborated ; but those who are only slightly acquainted with chemical manipulations will not want more than the poet's hint to see the force of his theory.

He states the same truth in another form in *Pietro* :—

> "Fair and good are products—of Foul and Evil : one must bring to pass the other.

Just as poisons grow drugs, steal through sundry odd ducts
Doctors name, and ultimately issue safe and changed.
You'd abolish poisons, treat disease with dainties
Such as suit the sound and sane? With all such kickshaws vain you pother!
Arsenic 's the stuff puts force into the faint eyes,
Opium sets the brain to rights—by cark and care deranged."

In that sublime poem *Easter Day* (p. 191) there is a very remarkable instance of Mr. Browning's way of wrapping up a great scientific truth in two or three words, and leaving it without recurring to it, or drawing attention to the force of the illustration by elaboration of the idea. Browning never beats his nuggets into leaf—it is rather in its very concentration that his force exists.

> "Thy choice was earth: thou didst attest
> 'Twas fitter spirit should subserve
> The flesh, than flesh refine to nerve
> Beneath the spirit's play."

How many thousands of readers have passed over these most remarkable lines and missed all their force and beauty, because, unlike the author of them, who seems to have a perfectly

voracious appetite for facts, they did not know they contained a precise statement of the origin of the nervous system according to our greatest physiologists. *Easter Day* was, I think, written in Florence in 1850. I believe it was not till 1855 that Herbert Spencer published his *Principles of Psychology*, and therein speculated on the evolution of the first rudiments of a nervous system in Medusæ and other low types of animal life; his speculations having since to some extent been confirmed by the investigations of Romanes and Eimer. Herbert Spencer points out how an impression or stimulus comes to habitually traverse a certain path along the lines of least resistance, thus leading to a differentiation of the protoplasm. Bastian, in his *Brain as an Organ of the Mind* (p. 21), says, "Wherever external impressions produce molecular movements which traverse with frequency some definite path, the transference of such movements is made easier by each repetition, and there is a tendency to the initiation of a structural change along this path. Ultimately by the constant repetition of such a process we should have the gradual formation of an actual 'Nerve fibre.'"

Now I know of no writer anterior to Mr. Spencer who suggested this as the process by which nerves are formed; yet Mr. Browning—in a highly concentrated manner it is true, but still actually—seems to have anticipated the great and interesting discovery.

In *Numpholeptos* (p. 97) these lines occur:—

> "As flash may find
> The inert nerve, sting awake the palsied limb."

The reference is to the use made of electricity in medical science, and the fact that by its aid a paralysed muscle can be restored to its normal condition. No reader of Browning can have failed to remark how great an accumulator of facts he is—facts of all sorts, and from every conceivable and out-of-the-way place. Odd scraps of lore here and there on every possible subject demonstrate that nothing in the range of human learning is beneath his notice or unworthy of being treasured in his storehouse; this is essentially the scientific habit of mind, and this habit has largely contributed to his greatness. Voltaire said, "There can be no great poetry without great wisdom," and Horace had said it before him. Although it is true

enough that the poet is born and not made, it is equally true, as Carpenter says, "that the imaginative faculty may be directed and invigorated, cultivated and chastened by volitional effort." Mr. Browning's industry it is that makes him so difficult to the careless reader.

If at times he is unintelligible, it is because he knows so much more than we do. The automatic action of our faculties is in direct proportion to their exercise; and it is because Browning has travelled over so vast a range of subjects, getting at the soul of all things, and analysing the deepest things of man, that he has become to us the seer and the sayer of the abysmal things of life and their awfullest mysteries. He knew what was required of him. "A poet must be earth's essential king," he declares. He who aspires to the poet's crown needs everything. "Red, green, and blue that whirl into a white, the variance now, the essential unity which makes the miracle." And this reminds me that Browning makes very great use throughout his work of similes derived from his study of light. Here are a few:—

"Rather learn and love each facet flash of the revolving year!
Red, green, and blue that whirl into a white."
Ring and Book, vol. i. p. 71.

"Only the prism's obstruction shows aright
The secret of a sunbeam, breaks its light
Into the jewelled bow from blankest white;
So may a glory from defect arise!"
Poems, vol. vi. p. 151.

Again—

"Light, thwarted, breaks
A limpid purity to rainbow flakes."
Sordello, p. 170.

Self-sacrifice he terms losing "the varicolour in achromatic white."—*Fifine*, p. 65.

The singularly beautiful poem *Numpholeptos* owes its remarkable imagery to the figure of light rays decomposed by gems, the perfect white of the diamond sending forth prismatic colours, and these again traced back to their source leading to the pure cold moonbeam. So the pure white silver light of the loved one rays forth blood-streaks, sun warmth, sun light, and salvation.

"Warms the soul, it sweetens, softens.
'What fairy track do I explore?
What magic hall return to, like the gem,
Centuply angled o'er a diadem?

You dwell there, hearted; from your midmost home
Rays forth—through that fantastic world I roam
Ever—from centre to circumference,
Shaft upon coloured shaft,' this crimsons thence,
That purples out its præcinct through the waste.
Surely I had your sanction what I faced,
Fared forth upon that untried yellow ray,
Whence I retrack my steps?

. . . . . .

Irradiation, late triumphant through the distance finds its fate
Merged in your pure blank soul, alike the source and tomb of that prismatic glow."

Numpholeptos, p. 101.

As a commentary on this suggestive poem, consider the influence the study of the life and character of the Virgin Mary has had on the minds of millions of men and women. The pure moonbeam of her smile has proved to this a path of gold, "for gold means love," to another many a daring crimson, blood-red path of passionate devotion, such as filled that Spanish knight of Isabella's who braved the fury of the Moor, and wrote Our Lady's name over the portals of the mosque at Granada. To how many others a violet path of humble service and devotion! A pure ideal, once dowered to the world, has never merely rested in its gem-like, faceted beauty, but has brought

forth bright and glorious paths of colour that have filled our souls with every kind of grace and loveliness. The conception of the idea of Our Lady, though it were founded in no historic basis of fact, has done the work of the faceted gem to beautify all that came within the scope of its glory. We owe this exquisite illustration to Browning's study of decomposed rays of light, and their recomposition into complete or white light.

In Professor Tyndall's address on the Scientific Limit of the Imagination he tells us that "two-thirds of the rays emitted by the sun fail to arouse in the eye the sense of vision. The rays exist, but the visual organ requisite for their translation into light does not exist. And so, from this region of darkness and mystery which surrounds us, rays may now be darting which require but the development of the proper intellectual organs to translate them into knowledge as far surpassing ours as ours surpasses that of the wallowing reptiles which once held possession of this planet."

Mr. Browning, in *Jochanan Hakkadosh* states the same truth in other words, words that

I think we shall understand all the better after those of Professor Tyndall :—

"O Thou Almighty who canst re-instate
Truths in their primal clarity, confused
By man's perception, which is man's and made
To suit his service,—how, once disabused
Of reason which sees light half shine half shade,
Because of flesh, the medium that adjusts
Purity to his visuals, both an aid
And hindrance,—how to eyes earth's air encrusts,
When purged and perfect to receive truth's beam
Pouring itself on the new sense it trusts
With all its plenitude of power,—how seem
Then, the intricacies of shade, of shine,
Oppugnant natures—Right and Wrong, we deem
Irreconcilable? O eyes of mine,
Freed now of imperfection, ye avail
To see the whole sight."

Embryologists tell us that man, in his development in the embryo, passes through the various stages of fish, reptile, bird, and mammiferous quadruped, till it ultimately arrives at the human stage. Hugh Miller remarks the same thing of the development of the human brain; in succession we have the brain of the inferior natures till the unique character of the human brain is assumed. And if we carefully study the origin of mind in the lower animals we shall find there is scarcely an attribute pos-

sessed by man, scarcely a virtue or faculty that, in a more or less crude and undeveloped form, is not found in the creatures beneath us. We open our Browning and find he knows all about it. It is not new to him that "man is the sum total of all the animals."

In *Paracelsus* (p. 189), he says there are :—

"Imperfect qualities throughout creation
Suggesting some one creature yet to make,
Some point where all those scattered rays should meet
Convergent in the faculties of man.

. . . . .

Hints and previsions of which faculties
Are strewn confusedly everywhere about
The inferior natures, and all lead up higher,
All shape out dimly the superior race,
The heir of hopes too fair to turn out false,
And man appears at last."

And just as inferior brains and natures point to the advent of man, so did the early brain and nature of primeval man foreshadow the higher and nobler man, and so do now the powers and potentialities of our highest races point on, ever forward, to the man that is to be—

"Progress is the law of life, man is not Man as yet."
"But in completed man begins anew
A tendency to God." "For God is glorified in man."
Paracelsus, pp. 190, 191.

If there be any who hold that "man is Nature's crowning blunder," our poet is not of their number.

From Browning's earliest to his latest work we may gather hundreds of examples such as we have quoted, to show how deeply science has tinctured his thought and how heartily he is imbubed with its love. In *Pauline*, which in one sense is a prelude to *Paracelsus*, he again and again recurs to the theme so grandly elaborated in the latter work of the consecration of a soul to knowledge, one in whom was—

> "A principle of restlessness
> Which would be all, have, see, know, taste, feel, all."
>
> "This restlessness of passion meets in me
> A craving after knowledge."

As in *Paracelsus*, so in *Pauline*, the lesson for us is, knowledge must never be pursued at the expense of love.

With Browning it is ever love first, all things for love; but how deep is his sympathy for the knowledge cult his way of urging the lesson proves clearly enough. It is in *Paracelsus* (the work that posterity will probably estimate as Browning's greatest) that we must look for the strongest proof of his sympathy with man's

desire to know and bend the forces of nature to his service. To some students this magnificent work will appear only the string of pearls and precious stones that some of us consider *Sordello* to be. To others it is a drama illustrating the contending forces of love and knowledge, others again find in it only an elaborate discussion on the Aristotelian and Platonic systems of philosophy; it is none of these alone; rather, if a single sentence could describe it, it is the Epic of the Healer, not of the hero who stole from heaven a jealously-guarded fire, but of him who won from heaven what was waiting for a worthy recipient to take and help us to. In so far as Paracelsus came short, it was deficiency of love that hindered him; of his striving after knowledge and what he won for man, the epic tells in words and music that to me at least have no equal in the whole range of literature. At its full value does the poet appreciate the God in man, the knowing Spirit which man is only now beginning to dare look in the face. Dreaded by theologians and hated by all the Churches, from the Eden legend to the last Encyclical, the story is ever the same: Knowledge is dangerous to man, and faith is all. In

Paracelsus the thing condemned is not knowledge without faith but knowledge without love, to—

> "Know, not for knowing's sake,
> But to become a star to men for ever;
> Know for the gain it gets, the praise it brings,
> The wonder it inspires."

Paracelsus has a message for our time. The tragedy of knowing without loving is often enacted now; and where the intellect is dissevered from the heart the end will be hard to keep from madness.

Wisdom demanded of Paracelsus—

> "Wilt thou adventure for my sake and man's
> Apart from all reward?"

If the man of science cannot inscribe on his banner "Apart from all reward," he is not fit to enter the service of man. Says Tyndall: "Imagine Dr. Draper spending his days in blowing soap-bubbles and in studying their colours! Be it remembered it was thus that minds like those of Boyle, Newton, and Hooke were occupied, and that on such experiments has been founded a theory the issues of which are incalculable."—*Tyndall, "Light,"* p. 66.

The World knows little of the work done by men who long to—

> "Save mankind,
> To make some unexampled sacrifice
> In their behalf, to wring some wondrous good
> From heaven or earth for them, to perish, winning
> Eternal weal in the act; as who should dare
> Pluck out the angry thunder from its cloud,
> That, all its gathered flame discharged on him,
> No storm might threaten summer's azure sleep!"
>
> *Paracelsus*, p. 62.

Yet in a thousand laboratories and students' cells this is being done at the present moment by men who have "all our varied appetites for joy derived from common things." "Men whom every common pleasure of the world affects as ourselves," but who "dare aspire to *know*—that in itself alone shall its reward be, not an alien end blending therewith!"

It is most remarkable, that long before the scientific men of our time had given Paracelsus credit for the noble work he did for mankind, and the lasting boon many of his discoveries conferred upon the race, Mr. Browning, in this wonderful poem, recognised both his work and its results at their true value, and raised his reputation at this late hour from the infamy with

which his enemies and biographers had covered it, and set him in his proper place amongst the heroes and martyrs of science. We owe the poet a debt of gratitude for this rehabilitation. No man could have written this transcendent poem who had less than Browning's power of thrusting aside the accidents and accretions of a character, and getting at the naked germ from which springs the life of the real man. That no follower of medicine, no chemist, no disciple of science, did this for Paracelsus is, in the splendid light of Mr. Browning's research and penetration, a remarkable instance of the fact that the unjust verdicts of a time and a class need to be reversed in a clearer atmosphere, and in freedom from class prejudice not often accorded to contemporary biographers. A poet alone could never have done us this service; and a single attentive perusal of this work is enough to show that the intimate blending of the scientific with the poetic faculty could alone have effected the restoration. How lovingly the poet has taken this world's benefactor's remains from the ditch into which his profession had cast them, and laid them in his own beautiful sepulchre, gemmed, chiselled, and

arabesqued by all the lovely imagery of his fancy, no reader of Browning's *Paracelsus* needs to be told.

It might have been a Sir Charles Bell who wrote the lines on the Human Hand. Browning must have a knowledge of its structure more than skin-deep.

> "Flesh and bone and nerve that make
> The poorest, coarsest human hand
> An object worthy to be scanned
> A whole life long for their sole sake."
>
> *James Lee's Wife.*

Of the painter who is an anatomist he says—

> "To him the bones their inmost secret yield,
> Each notch and nodule signify their use;
> On him the muscles turn, in triple tier,
> And pleasantly entreat the entrusted man:
> 'Familiarize thee with our play that lifts
> Here, and then lowers again, leg, arm, and foot!'
> —Ensuring due correctness in the nude."

Even the mysterious technicalities of a medical prescription are not hidden from our poet; he knows the principles upon which an intelligent physician proceeds, when he writes one—

> "Ask, now, a doctor for a remedy!
> There's his prescription. Bid him point you out

Which of the five or six ingredients saves
The sick man. Such the efficacity?
'Then why not dare and do things in one dose
Simple and pure, all virtue, no alloy
Of the idle drop and powder?' What's his word?
The efficacity, neat, were neutralized;
It wants dispersing and retarding,—nay,
Is put upon its mettle, plays its part
Precisely through such hindrance everywhere:
Finds some mysterious give and take i' the case,
Some gain by opposition, he foregoes
Should he unfetter the medicament."

Prince Hohensteil Schwangau, p. 78.

I will not trouble you with explaining how accurate this is, but I may say it is a precise statement of the methods that guide the pharmacologist, and affords the poet an admirable illustration of the method of our education and development in a world of contending forces and a pilgrimage of dangers and difficulties that, rightly met, subserve perhaps the highest interests the Great All-Father had in view for us when He placed us in their midst.

Browning's optimism is in complete accord with the teachings of science. James Hinton, in one of his pregnant sentences, says, "Every evil, every failure or loss, becomes tributary to a greater good."

Browning declares that—

"Evil's beautified in every shape."

"Upon men's own account must evil stay."

"For mankind springs salvation by each hindrance interposed, they climb."

Pessimism has no place in his system of philosophy.

"Time means amelioration, tardidly enough displayed,
Yet a mainly onward moving, never wholly retrograde."
La Saisiaz.

As the unused muscle wastes away, the unexercised brain daily grows feebler and feebler, and all the powers of man's body demand exercise if they are to be retained in their integrity; so, in Browning's system, evil is our stimulus, whereby we evolve all the good we can hope to get from this our mortal life.

The character of Count Guido, in the *Ring and the Book*, is drawn with scientific accuracy, and is elaborated with precision and great skill. He has the true aspect of the ingrained villain, a man who could not help being one. A jury, composed of nineteenth-century Royal Academicians and physicians would have consigned him to a criminal lunatic asylum. I am sorry

we have not his skull on the table to-night. You would have found the facial angle extremely small, and doubtless some very interesting facts accounting for his character could have been discovered. Count Guido has left us his picture, painted by himself :—

"Wipe out the being of me
And smear my soul from off the white of things I blot ;
I am one huge and sheer mistake.
Whose fault ? Not mine, at least,
Who did not make myself."

Pompilia's sketch gives us his photograph :

"Guido Franceschini—old
And nothing like so tall as I myself,
Hook-nosed and yellow in a bush of beard,
Much like a thing I saw on a boy's wrist,
He called an owl and used for catching birds."

No doubt the family history of the Count would give us some adequate reasons for concluding that he was in very truth "one huge and sheer mistake."

There is nothing "miraculous" (as has been said) in the stainless purity and beauty of Pompilia's character. The poet's abounding faith in Nature, his optimism and faithful observation of character, have drawn for us in Pompilia, a

lovely, but by no means an impossible picture. Her character, we are told, taken in connection with her surroundings and parentage, is marvellous. As we do not read that her father was an habitual drunkard, or that her mother was either the subject of strumous diathesis or a microcephalic idiot, the marvel is not very apparent to the scientific mind. Her mother followed the calling of a washerwoman, and was probably a well-developed, healthy person.

Now, given good development and initial vitality at its best, Nature is very successful in continuing the species on the highest lines, quite regardless of ecclesiastical ceremonies or parochial registrations. Disclaiming any, the least desire to undervalue the importance of either, many reasons might be given why Nature so often uses such material with triumphant success; certain it is that those who have the best reasons for knowing, often find Pompilias in very unlikely surroundings. To those who often become weary of trying to elevate other minds to their own level, it should be a source of satisfaction that it is well-nigh as difficult to efface the image of the Divine in man as to restore it when obscured by vicious

habits and evil tendencies, for which their possessors cannot always fairly be held responsible. After all, education and environment do not effect so much either of good or evil as we often suppose. Otherwise in the homes of the brutal, the sensual, and the degraded, we should not find so many bright, innocent, and pure natures; nor in the families of the high-born and cultivated, so many degraded types.

To some temperaments it is just as difficult to be evil as to others to be pure and good.

The characters of Guido and Pompilia are then perfectly natural. When the soul of Pompilia came within the path of Guido's, we find the repulsion that evil ever has for good.

> "And when he took my hand and made a smile—
> Why—the uncomfortableness of it all."

Bad men are often repugnant to good dogs.

To the man who refuses to believe in God, because he cannot find Him with his telescope, and whose microscope reveals Him not, Robert Browning declares—

> "The Name comes close behind a stomach cyst,
> The simplest of creations. . . .
> . . . The small becomes the dreadful and immense."
> *Sludge*, p. 203.

To him who will not believe in soul because his scalpel cannot detect it, he says, Show me first an atom! Immortality incredible? Your atom is a truly immortal being!

In one of the finest passages in *Ferishtah's Fancies* he discusses this difficulty, which the materialist has to face.

"To know of, think about—
Is all man's sum of faculty effects
When exercised on earth's least atom, Son!
What was, what is, what may such atom be?
No answer! Still, what seems it to man's sense?
An atom with some certain properties
Known about, thought of as occasion needs,
—Man's—but occasions of the universe?
Unthinkable, unknowable to man.
Yet, since to think and know fire through and through
Exceeds man, is the warmth of fire unknown,
Its uses—are they so unthinkable?
Pass from such obvious power to powers unseen,
Undreamed of save in their sure consequence!
Take that, we spoke of late, which draws to ground
The staff my hand lets fall: it draws, at least—
Thus much man thinks and knows, if nothing more."

Ferishtah, p. 131.

When we reflect how infinitely little we know of these atoms here spoken of, and of that mysterious force of gravitation, and the medium through which it acts, referred to in the last

lines, it is not surprising we should be unable to solve the greater problems of life, the soul and God.

If it be contrary to received notions that in Browning we have a scientific poet, is it not still more remarkable that in a scientific man we have faith in some at least of the great doctrines of the Christian religion?

Would not his dissecting, analysing spirit prove a solvent for creeds? If we knew him less we might also predicate this of him. Nothing, however, could be more contrary to the fact. Again and again he warns us that we must not put religion into an alembic, must not resolve faith into its elements, analyse the pearl of great price, pump all the air out of the great Christian verities. In a word, he tells us "a scientific faith's absurd—frustrates the very end it was meant to serve" (*Poems*, vol. v., p. 170).

"You must mix some uncertainty with faith, if you would have faith be" (*Poems*, vol. v., p. 168).

He complains of the "exhausted air-bell of the critic"—that it "leaves no air to poison" (*Poems*, vol. v., p. 149), consequently none to

breathe, "pumps out with ruthless ingenuity atom by atom, and leaves you—vacuity."

He tells us of the Göttingen professor, who, with strange inconsistency, but exactly as our Comtist and Agnostic philosophers are always doing—

> "had done his best;
> And the pearl of price, at reason's test,
> Lay dust and ashes levigable
> On the Professor's lecture table.
> When we looked for the influence and monition
> That our faith, reduced to such condition
> Be swept forthwith to its natural dust-hole,—
> He bids us, when we least expect it,
> Take back our faith,—if it be not just whole
> Yet a pearl indeed, as his tests affect it."
>
> Vol. v., p. 156.

Which is exactly what our new lights are doing with Christianity—grinding it to an impalpable powder, and bidding us take the greatest care to sweep up what they have left and religiously conserve it. But fine dust is not a pearl; and carbon, hydrogen, and oxygen in pint measures are not exactly a loaf of bread. We cannot adorn ourselves with the one, nor feed ourselves with the other. Browning tells us—

> "The originals of faith . . .
> The causes, were they caught and catalogued,

Would too distract, too desperately foil
Inquirer. How may analyst reduce
Quantities to exact their opposites
Value to zero, then bring zero back
To value of supreme preponderance?
How substitute thing meant for thing expressed?"
Red Cotton Night-cap Country, p. 196.

Yet he has some words of stern rebuke for Religion, that remind us of Dr. Draper framing his terrible indictment against her for her constant opposition to Science. How she sat:

"Prim in place, Religion overlooked
And so had done till doomsday, never a sign
Nor sound of interference from her mouth,"—

while the rack pulled bone from bone, and the followers of Science were mauled and maimed. When Science became too strong for Religion longer to suppress, after first looking around for help not forthcoming, Religion acquiesced:

"What, broken is the rack? Well done of thee!
Did I forget to abrogate its use?
Be the mistake in common with us both!"

And the indignant poet turns upon her and cries:

"Ah but, Religion, did we wait for thee
To ope the book, . . .
We should wait indeed!
That is all history."
Ring and Book, vol. i., p. 52.

I saw once in Madrid, a few hundred yards from the scenes of the medieval autos da fé, a ballet, *The Genius of Progress contending with Superstition.* In one scene a monk incites the people to destroy the first steam-boat and its inventor. That done, in the next, Progress waved her wand, and a Mississippi water-palace bore her thousand passengers on the wave. I thought of Browning and the lines in *Pietro*, how "the priests came prying, broke his engine up, and bastinadoed him beside."

But if we culled from the works of Mr. Browning all the passages that prove the permeation of his mind by the scientific habit, we should weary you, even if we have not already done so. The passages quoted are ample to show that, whatever our notions of poets and poetry may be in relation to science, we have in Browning a writer who is abreast of the highest culture of his time, who clothes hard, dry facts of science in highly poetical language, and invests their conception with all the glamour of his art, extracting from a soil usually considered unpromising, luxuriant growths of most exquisite fancy, and above and beyond all this, one of whom we may say,

in his own terse and pregnant lines, that we may—

'Confidently lay to heart, and lock in head our life-long, this:
He there with the brand flamboyant, broad o'er night's forlorn abyss;
Crowned by verse, and wielding, with wits' bauble, learning's rod,
Well? Why, he at least believed in soul, was very sure of God."

APPENDIX.

IT has been thought advisable to append some references to Mr. Browning's method of dealing with scientific matters, that readers may have an opportunity both of seeing how wide is the poet's acquaintance with such things, and judge for themselves what is his attitude toward science in general. The list of references makes no pretension to be an exhaustive one, it could be considerably amplified by a careful reperusal of the works, but it will suffice for the purpose. The references are to the original edition of the poems, in six volumes, and the first edition of the *Ring and Book.*

Anatomy.—Poems, v., p. 152; vi., p. 58. Fifine, p. 68.

Astronomy.—Prince H. S., p. 90. Sordello, pp. 187, 188.

Botany.—Poems, i., p. 104; v., pp. 193, 208, 228 312. Fifine, p. 14. Sordello, p. 20.

Chemistry.—Poems, iii., pp. 219, 220; iv., p. 238; v., pp. 155, 156. Prince H. S., pp. 44, 91. Red Cotton, p. 196. Croisic, pp. 90, 92. Fifine, pp. 65, 97, 130; Ferishtah, pp. 39, 40, 45, 76. Pippa P., p. 250. Sordello, p. 194. Ring and Book, i., p. 2.

Electricity.—Poems, vi., pp. 183, 203. Red Cotton p. 196. Fifine, p. 115.

Evolution.—Poems, i., p. 188. Prince H. S., p. 68. Fifine, p. 162. La Saisiaz, p. 57.

Physiology.—Poems, v., p. 191. Sordello, p. 195. Tray.

Scientific Matters in General.—Poems, v., pp. 128, 302; vi., p. 203. Dramatic Idylls, ii., p. 68. Fifine, pp. 51, 86. La Saisiaz, pp. 69, 82. Ferishtah, p. 131. Sordello, pp. 25, 203; Ring and Book, iv., pp. 61, 77, 180.

Considerable discussion was caused amongst Browning students by the publication of my paper on this

subject. Amongst other communications two letters from distinguished literary women were published in the *Browning Society's Notes and Transactions.* I here venture to republish them with my reply, as the question is a very interesting one, as bearing upon the idea which Mr. Browning has done so much to dissipate, that poetry must necessarily be all sugar and water.

BROWNING AS A SCIENTIFIC POET.—"I don't think I could do a more cruel turn to a poet than to prove him to be scientific, or to have displayed his scientific acquirements in his poetry!

For why? Because—*selon moi*—

1st. The scientific way of viewing all things is precisely the converse of the poetic. The scientific is analytic—the poetic synthetic; the man of science is busy finding out distinctions and tracing causes—the poet ought to be engrossed in the aspect of resemblances, comparisons, appearances. Think of any poem super-eminently poetic—*e.g.*, *The Sensitive Plant.* Imagine *that* treated scientifically. Describe the plants as cryptogams and phenogams, monandria and polyandria. Cut out all such unscientific folly as describing the Lily of the Vale made pale by passion, or the Hyacinth ringing sweet peals from its bells, and the Narcissus admiring itself in the water. The difference between your botanic garden and Shelley's garden will be exactly the difference, I think, between scientific poetry and true poetry.

2nd. I believe that the emotions—which it is the business of all Art, but chiefly of the greatest Art,

poetry, to stir and elevate—are in their nature complementary to the intellect, which is the realm of science; and that in proportion as the one part of our nature is being excited, the other is temporarily quiescent. The alternations may be rapid, and we may slip from a high peak of intellectual climbing on to an Alpine rose-bed of rich emotion; but this is an exceptional chance, and the rule, I apprehend, is that *busy thought* is *cold feeling*, and *vice versâ*.

Are we, therefore, to lay it down that poetry ought not to deal with subjects intellectually difficult or abstruse?

It seems very hard to draw the line, and I cannot profess to say I could formulate a rule to my own satisfaction, much less for that of others. But I think the principle must be, that there should never be required of the reader (assuming him to be a fairly cultivated man) to stop in mid-career of a burst of poetry to say, 'What the deuce does this poet mean? What *is* this substance—this plant—this disease—this author—this battle—of which he is talking?' Recourse to a lexicon or a cyclopædia is the very last thing which a poet should even suggest to his readers. Thus, I should say that when a fact of science (*e.g.*, that the earth goes round the sun) has become *familiarly known*, it is open to every poet to speak of the earth's motion accordingly. But it would not have been proper to do so in Shakespeare's days, and it would not now be well to introduce the Precession of the Equinoxes into an ode. In like manner, as everybody now knows something

about the saurians, Tennyson was quite right to talk of

> 'Dragons of the prime
> Which tare each other in their slime.'

But if he had gone on to speak of the dental formula of the Labyrinthodon, it would have been the reverse of poetic.

I must say I think it is *too* audacious coolly laying it down, that 'only in an age of science can anything worthy of the name of poetry exist.' Shades of Isaiah, Homer, Æschylus, Dante! He does well to make the most of Lucretius—the only poet of the past who (so far as I know) can be described as scientific at all, and whom it is the fashion in these days to laud to the skies, both because he is scientific and because he is atheistic.

Is there not a rule which applies to Art of every kind, and, of course, to Poetry *par excellence*, that it ought, as its supreme end, to excite the emotion of the *Beautiful?* According to my idea, the concern of Literature is with the True—of Art with the Beautiful, and, of course, with all emotions which may be associated with the sense of Beauty—Pity, Terror, Admiration, Awe, etc. When anything is introduced into Art which calls forth the opposite emotions—the sense of disgust, of *mesquinerie*, pettiness, and ugliness—it is the antithesis of Art, and, so far as it goes, a direct subtraction from it—*e.g.*, when Rubens represents a dog lapping the blood in the brazen pan in his 'Crucifixion.'

Now I maintain that several of the examples given of Scientific Poetry involve this direct offence against the fundamental principle of Art. The epidemiologist hunting up cholera bacilli may (or may not) be *morally* great, but he is æsthetically beastly! When Browning talks of the child "ichoring" over the place where he had felt God (as if God left a scab!) it makes one think of a nasty little itchy child, and to shiver! I could not feel *poetry* for three pages after such a metaphor."

Z.

BROWNING AS A SCIENTIFIC POET.—"Dr. Berdoe undeniably uttered a paradox when he said that Browning, as poet, was gifted with the scientific habit, and pursued the scientific method, of thought; and 'Z.' has delivered himself of as obvious a truism, in declaring that the poetic and the scientific method are incompatible. But this is little more than a question of words. What Dr. Berdoe *meant* must be sought in the general drift of his assertions, and tested by the works to which they refer; and the smallest effort in this direction will reveal two facts: that when Dr. Berdoe speaks of scientific *thought*, he is thinking of scientific *imagination*: of 'the deeper insight into the hidden things of nature,' which is not always combined with the 'highest poetic faculty,' but seems a natural complement to it; and that in calling attention to the scientific element in Mr. Browning's imagination, he reaffirms that profound truth to nature which is the secret of Mr. Browning's poetic

power. It is a mistake to think, as 'Z.' apparently does, that Science and Poetry are opposed to each other. Their received antithesis lies, not in the things themselves, but in the minds which pursue them: in the habit of mind, which, in its lower stages, the pursuit of science involves. The higher scientific truths belong to the imagination; they are elicited by it; they exist in and for it. Their province is therefore that of the poet; they have their natural analogies in poetry. Mr. Browning's employment of scientific facts is always inspired by these analogies, whatever the special quality of the facts may be; and Dr. Berdoe shows, by both quotation and comment, that it is so. The lines given by him from *James Lee's Wife* display a knowledge of anatomy reducible to the lower planes of science; but they form part of an almost impassioned tribute to the wonders of the human frame—its embodied gospel of Work—its embodied lesson of reverence, patience, and self-effacement. *Deaf and Dumb* and *Numpholeptos* are each a parable of the laws of light. Neither could have been written before the prism was known. But the one contains in its few lines a spiritual philosophy of life. The suggestiveness and the glamour of true poetry reach their climax in the other. The word 'ichor,' to which 'Z.' so much objects, signifies in the present case the ethereal fluid which was supposed to supply the place of blood in the veins of the gods. It belongs to the purest poetry of waste and repair; and any reference which 'Z.' may see in it to the condition of an itching or scabby child must

be charged to his own mind. That the discoveries of science are the property of the poet's imagination is further proved by this, that it can on occasion forestall them. The quoted passage from *Paracelsus* is a poetic statement of the doctrine of Evolution made long before its scientific basis had been laid down; at a time when it was still blasphemy to speak of Creation as otherwise than accomplished in the course of six days and out of nothing.

'Z.' employs a poem of Shelley's, *The Sensitive Plant*, to illustrate the anomaly of carrying the ideas of science into poetry. 'Imagine,' he says, '*that* treated scientifically. Describe the plants as cryptogams and phenogams, monandria and polyandria. Cut out all such unscientific folly as describing the Lily of the Vale made pale by passion, or the Hyacinth ringing sweet peals from its bells, and the Narcissus admiring itself in the water. The difference between your botanic garden and Shelley's garden will be exactly the difference, I think, between scientific poetry and true poetry.' I venture to reply that if the plants were only described as 'Z.' 'imagines,' by their botanical terms, the result would be a scientific report, and not a poem at all; but that if they were described, as Browning might describe them, in the activities which these terms denote: in the romance, and the mystery, and the humanity of their reproductive existence, we should have a poem at least as genuine as one which invests them with fanciful attributes, dealt out as the mood of the poet or the swing of the verse suggests.

'. . . the Naid-like lily of the vale,
Whom youth makes so fair, and passion so pale,'

sounds charming so long as we do not stop to ask ourselves why the lily should resemble a nymph, and yet be always pale with passion; or whether it is nice for such a young person to be so; but the idea is feeble at best when compared with that of Browning's sunflower, in *Rudel to the Lady of Tripoli*, of which the vivid and pathetic human imagery conveys a natural fact. I have no wish to disparage Shelley, who has written finer things than *The Sensitive Plant*, and given us even here finer, because truer, images than two out of three of those which 'Z.' quotes. Nor would I speak disrespectfully of the great poets of a less scientific age; though I fancy that if we approached their works in the same spirit in which we read those of our own time, a little of them would sometimes go a long way. I agree with 'Z.' that Christopher North overstates his case when he asserts that, 'Only in an age of science can anything worthy of the name of poetry exist.' But I entirely feel with Dr. Berdoe, that that poet must be the greatest whose genius reflects in fullest union the passions which are of all time, and the mental experiences which characterize his own; and that the poet of the scientific age is, other things being equal, by so much greater than his predecessors, that he inherits the longest past, and therefore the richest present, and reproduces it.

It would, however, be sophistry to deny that other things seldom *are* equal. If the scientific age creates

the best materials for poetry, it also creates the worst atmosphere for it; were it only that it produces a large class of readers who refuse themselves to the faintest effort of imagination. 'Z.' is of opinion 'that there should never be required of the reader (assuming him to be a fairly cultivated man) to stop in mid-career of a burst of poetry to say, "What the deuce does this poet mean? What *is* this substance —this plant—this disease—this author—this battle—of which he is talking?" Recourse to a lexicon or a cyclopædia is the very last thing which a poet should even suggest to his readers. . . .' So am I. But what compels the reader of Browning, in three cases out of four, to have recourse to the cyclopædia, except his own belief, that the things and facts in question mean nothing unless they are to be found there: his inability to admit that, whether real or imaginary, their relation to the main idea, *i.e.*, their illustrative value, is the same? Mr. Browning is to blame for this in some of his works, because their illustrations are often too remote to convey the intended idea; but even where his poetic intention is transparent, the same demand for chapter and verse is made upon him. 'Imagine' *The Sensitive Plant* read in the same manner as those poems of his to which the last issue of the Browning Society's *Queries* refers, and the kind of speculations concerning it which a Shelley Society would bring to light. 'Was the garden suggested by any particular garden?' 'Was the lady suggested by any particular lady?' 'Where did Shelley probably locate

the garden?' 'Is a garden possible which contains plants and flowers requiring such different soils and atmospheres?' 'Of what species of sensitive plant is the one described?' . . . to say nothing of all the questions involving just criticism which are raised by the often arbitrary images or imperfectly marked ideas of the poem."

O.

The criticism of "Z." in the last number of *Notes and Queries* is so able that I should not have found anything to object to in it had I felt sure it was directed against what I did say in my paper on Browning as a scientific poet, instead of being an elaborate argument against what I did *not* say. In the first place, I did not maintain that Browning treats poetic subjects scientifically, but scientific matters poetically—quite another thing. Neither is there any question of "display" in his method. The scientific habit is as natural to him as his poetry. One does not "display" a pair of beautiful eyes—I thought I had made this clear. "Z.'s" argument, if it proves anything, proves too much—it proves that Browning is not a poet at all! We are told, "the scientific way is analytic," "the man of science is busy finding out distinctions and tracing causes." Is not the *Ring and the Book* analytic? Does not the poet there busy himself "finding out distinctions and tracing causes"? There is plenty of analysis in that poem—and plenty of poetry too. This is just what Browning students always claim for him, that

he does "find out distinctions and trace causes," and some of them think all this enhances his claim as a poet. I apprehend there is a great difference between the scientific method and its terminology. I purposely excluded "the cryptogams and phenogams, monandria and polyandria," when I said, "Not in the sense satirized in the *Loves of the Plants*, but in the fact that he has so largely imbibed and *assimilated* the science of the time." To me the latest revelations of botanical science are infinitely more suggestive of poetry than the fables of Ovid about the origin of trees and flowers. Is that only poetic which deals with the unreal and absurd? I am unable to say what is the temperature of people who "slip from a high peak of intellectual climbing on to an Alpine rose-bed of rich emotion." Unhappily, we sometimes are called to poor men who slip from housetops on to iron railings; in these cases the "cold feeling" is undoubted. "Z." lays down a canon that poetry does not become such till people are able to understand it without lexicons and cyclopædias. So there is hope for Mr. Browning yet! When the Board Schools have done a little more for us, we shall discover our poet. But to be logical, "Z." should at least admit him to be a poet to those who do understand him now. If that is not true poetry which cannot be properly understood without cyclopædias and dictionaries, how about Dante? What proportion of his readers could understand him without some such notes as Carey's? And is there not a Shakespeare Society that affords very

19. Warwick Crescent.

W.

June 11. '85.

Dear Dr. Berdoe,

I have again to express my sense of the obligation your goodness lays me under by the paper in which you so generously estimate my attempts to make use of the few materials of a scientific nature I have had any opportunity of collecting: would they were of more importance.—but my gratitude to whoever takes the will for the deed is all the greater. Pray accept my sincere thanks, and believe me,

Dear Dr. Berdoe,

Yours truly ever

Robert Browning

considerable help to his students? Isaiah, Homer, and Æschylus want explanation, too! It was not I, but Christopher North, who said, "Only in an age of science can anything worthy of the name of poetry exist." He goes on, in my quotation, to say that uncivilized man has not produced any poetry worth "a tinker's farthing." Commenting on this passage "Z." exclaims, "Shades of Isaiah, Homer, Æschylus, and Dante!" Neither I nor North claimed the present as the only age of science; still further from our thoughts would it be to designate those poets as "uncivilized" men. "Z." says "Lucretius was the only poet of the past who can be described as scientific at all." What about Michael Angelo and Goethe?

Leonardo da Vinci very successfully combined his science with art, too, even if he did not write poetry, as Raffael did—indifferently.

"Z.'s" essay on poetry is very clever and very interesting, but it is not a criticism of my paper, as it is directed against a line of argument not advanced therein.

E. BERDOE.

The letter on the opposite page was written by Mr. Browning after the publication of my paper on his scientific allusions.

LIBRARY

BROWNING'S SCIENCE.

A GREAT poet, fully conversant with the science of his time, in sympathy not only with the aspirations of his age, but with its intellectual progress, must necessarily exercise an influence upon the educated and thoughtful far beyond that possessed by poets, however great, whose only object is to express artistically the emotions of the human mind in rhythmical language. Many eminent writers have maintained that science and poetry are opposed to each other, and that as the one flourishes so must the other decay. The poet, they say, deals with resemblances, comparisons, appearances; in a word, with the beautiful and its relations to the emotions of pity, terror, admiration, awe, etc. The scientist, on the other hand, occupies himself with finding out distinctions and tracing causes; in a word, with facts. According to these, it is little less than libellous to write of a poet that he is scientific, or of a man of science that he is poetic; it is in either case to detract

from the honour attaching to his proper work. If the ornithologist were to intrude himself upon us while we were enjoying *The Ode to the Nightingale*, or the poem of *The Skylark*, we should resent it as a personal affront. Who cares for meteorology when revelling in *The Cloud*, or for botany when delighting in *The Sensitive Plant?* Nothing is easier than to ridicule the idea of introducing genera and species, cryptogams and phenogams, into such associations as those of Shelley's *Garden*. This sort of thing has been done to perfection in *The Botanic Garden* and *The Loves of the Triangles*. Nevertheless, we maintain that, other things being equal, the poet who knows his natural history, his botany, and his physical science will write better poetry than he who knows nothing of these things. He will not, of course, worry us with his classifications and analysis, but his deeper penetration into the mysteries of Nature will enable him to impress us more entirely with a sense of his truth to Nature, of his nearness to and harmony with Nature in all her varying moods and phenomena. I may be pardoned for this introduction to what I have to say on Browning's

science, because I have for some years past occupied myself with pointing out to Browning students in England how much Browning's scientific imagination and learning enhance the value of his poetic work and his claims to recognition as a great teacher of the nineteenth century. Browning's work is as distinctly the product of the age of science as Petrarch's of the revival of learning.

No prophet can speak to the heart of his age who is out of sympathy with its work and hopes. Would he lead the minds of his time, he must know their thoughts and speak them better than they can themselves. He must invest himself in their mental dress and dignify it by his mode of wearing it; must take their crude longings and intimations and transmute them with the philosopher's stone of his genius into the gold of burning, shining thought, which shall dower the ages with a heritage for ever. He must not set himself to scold and scorn his age nor denounce the "down-grade" tendencies of its earnest, passionate thought; out of harmony with it, he can effect no good. To lead, he must love; to love, he must know. That Robert Browning is a great poet, it is

happily now too late to deny. It concerns me at present to indicate some of the reasons for estimating his work as part of the worthiest literary product of our time. Macaulay says that "the merit of poetry, in its wildest form, still consists in its truth." It is obvious that, to be true, a poet cannot know too much. Now there is not a mood of the human mind, from the mental agitation of a Pope debating high matters of Church and State to the squirming of a Sludge detected in his contemptible fraud, which is beyond the power of Robert Browning to analyze and explain. He is not only the heroes' poet or the singer of roundelays and the idyllist of empty days. It is the "poet's trade to feign," says Churchill; but Browning's work is rather to divine the hidden things of the human soul for us and open to us the hieroglyphics of nature. Analysis with him becomes inventive; he is "the maker" because he is so great an analyst. He unwraps and dissects so skilfully that the power of synthesis has come to him from the perfection of his knowledge of the materials in which he works. Take, for instance, his *Paracelsus*; so perfectly did he take to pieces the old myths

and legends about this reformer of medicine, that he has been able to reconstruct for us what is acknowledged by men of science to-day as the truest history of the man. See what he did with the meagre scraps of history of Count Guido Franceschini. He pulled that faded, worn, old book to bits, put it into the alembic of his brain, and distilled for us *The Ring and the Book*, which is doubtless much truer for us than would have been the actual facts and words seen by coarser eyes and heard by duller ears. Thus does analysis lead with genius such as his to synthesis; and for this I call him a scientific poet.

This is a consolatory fact, because it shows us that the progress of science need not be fatal to poetry. We shall understand our materials so much better, that we shall make more out of them. The chemist is the great manufacturer precisely because he is the great separater and resolver. Campbell said:—

> "When science from Creation's face
> Enchantment's veil withdraws,
> What lovely visions yield their place
> To cold material laws!"

But is it so? Tennyson speaks in one of his

poems of the "white star of snow"; before Mr. Glaisher's observations on snow-crystals he would have had to call it a "flake." There are many instances in the Laureate's works of the influence which modern scientific discoveries have exercised upon his genius. Browning's poems, however, teem with them, and this possibly is one element in their obscurity. It cannot be denied that one wants educating up to Browning; but the process will undoubtedly pay. In *Ferishtah's Fancies* he speaks of the human ear as "hungry for music." We shall miss the poet's meaning unless we know something of the organ of Corti, with its three thousand rods, the beautiful arrangement of which has been compared to that of the keys of a piano. In the next line he speaks of the "seven-stringed instrument" before the eye; here the reference to light and the seven colours of the spectrum is more obvious. In *Hohenstiel-Schwangau* we have the lines :—

> "Try to make good do good as evil does—
> Were just as if a chemist, wanting white,
> And knowing black ingredients bred the dye
> Insisted these too should be white, forsooth!"

Those experimenters with chemicals, who have made the beautiful white and blue fires out of black antimony and sulphur, will know what the poet means. In *Easter Day* there is a very remarkable illustration of Plato's maxim, that "poets utter great and wise things which they do not themselves understand." He says:—

> "Thy choice was earth: thou didst attest
> 'Twas fitter spirit should subserve
> The flesh, than flesh refine to nerve
> Beneath the spirit's play."

This poem was written five years before Herbert Spencer gave the first hints as to the origin of the nervous system in medusæ. He points out how an impression or stimulus comes to habitually traverse a certain path along the lines of least resistance, thus leading to a differentiation of the protoplasm. Mr. Bastian has shown how the constant repetition of such a process has gradually produced the "nerve fibre." How did the poet anticipate this great scientific discovery? Those students of the poet who are interested in the study of the science of optics will have remarked the important place which his light metaphors hold

in his poems. "Red, green, and blue that whirl into a white." . . . "The prism's obstruction shows aright the secret of the sunbeam." . . . "Light thwarted, breaks a limpid purity of rainbow flakes." In *Fifine* he speaks of losing "the varicolor in achromatic white." *Numpholeptos* is quite unintelligible without some acquaintance with optics.

How wonderfully he anticipated recent discoveries in evolution and embryology in his *Paracelsus* I have lately had occasion to explain. Though holding no brief for any of the Churches, it cannot be doubted that Mr. Browning is a Christian poet. His theology is so eminently reasonable that it commends itself to a large class of minds which have forsaken the Churches because modern criticism has laid rude hands on the dogmas, creeds, and documents upon which they are grounded. The study of comparative religions, the sciences of folk-lore, anthropology, and psychology have dissipated much of the supernatural which forms so large a portion of the older religious teaching. The great want of the age is a faith which is adequate to and consistent with its intellectual culture. I venture to think that such a system

of reasonable religious belief is to be found in the works of this great writer. I hail it with joy, not so much for its own completeness and perfection as for its indication of the direction in which we must look for the religion of the future. It is vain to deny that we live in a transition period as far as our faith is concerned. Many of the Churches resemble those wooden buildings in India which have been the prey of the white ant—they retain all their outward form and appearance of strength, but they will not resist the next high wind, for they are eaten through and through by the destroying insect. Churches and religious systems and societies, however, may collapse; but the "indestructible religious need" of the human race will be satisfied by a commensurate theology when even their very names are forgotten. In the beautiful words of Lotze, the great German philosopher, "The totality of all that has value—all that is perfect, fair, and good—cannot possibly be homeless in the world or in the realm of actuality, but has the very best claim to be regarded by us as imperishable reality." Man has often found that he has outgrown his gods; he will never outgrow such a

conception of God as that! He may part with his anthropomorphic conceptions of the Supreme Being; but "the mind which meditates in Beauty and speaks in Law" will ever be adored by thinking men. And we can worship Browning's God without loss of our self-respect. To do this he tells us we must—

> "Correct the portrait by the living face,
> Man's God by God's God in the mind of man."
> *The Ring and the Book.*—The Pope.

To Browning "God is the perfect Poet, who in His person acts His own creations," . . . "tastes an infinite joy in infinite ways," and "dwells in all, from life's minute beginnings up at last to man." In God is life for evermore, yet existence in its lowest form includes Him, as he tells us in the noble passage in *Paracelsus*, from which I quote. No one can read this without looking upon nature with "larger, other eyes." Matter is no longer the dead thing of the laboratory; it is "a crystallized thought of God." He cannot conceive that the All-powerful and All-wise could fail to—

> "prove as infinitely good:
> Would never, with power to work all love desires,
> Bestow e'en less than man requires."
> *Christmas Eve.*

It is not incomprehensible, therefore, to him that—

> "This one earth, out of all the multitude
> Of peopled worlds, as stars are now supposed,—
> Was chosen, and is sun-star of the swarm,
> For stage and scene of Thy transcendent acts,
> Beside which even creation fades
> Into a puny exercise of power."
>
> *The Ring and the Book.*—The Pope.

He can believe that "the very God," "the All-great," may be "the All-loving too,"—

> "For the loving worm within its clod
> Were diviner than a loveless god
> Amid his worlds."

But why does God never speak? He stands by, and, seeing all the evil and misery in the world, does nothing to stay it! How reasonable is Browning's answer. He says that God—

> "stands away
> As it were a handbreadth off, to give
> Room for the newly-made to live,
> And look at him from a place apart,
> And use his gifts of brain and heart."

The process of man's education could go on in no other conceivable manner. Man, otherwise, would not be man,—he would be a mere

machine, "Made perfect as a thing of course," but "his liberty of doing evil gave his doing good a grace." "I see no sign of God," says the scientist; "I can explain everything without Him!" Browning does not take him to the stars above, he bids him look through the microscope at —

> "the simplest of creatures, just a sac
> That's mouth, heart, legs, and belly at once, yet lives
> And feels, and could do neither, we conclude,
> If simplified still further in degree."

And what then? Why, "The Name comes close behind a stomach cyst," which is the designation the biologist gives that simplest of all living things which the poet has described; and this arrest of knowledge exactly indicates the high-water mark of the science of the day. The Name—God—is immediately behind that stomach cyst!—behind that veil we cannot peer, and the latest scientific word is, that there is not the least probability that we shall ever bridge the gulf between the not-living and the living. There stands science confounded—"thus far shalt thou come, and no farther." But if we boast that, though we cannot solve the mystery of life, we have mastered matter, "No!" cries

the poet, "the mere atoms despise" you! the awful, eternal atoms which no man hath seen nor can see, of whose ceaseless dance Tyndall has told us, of their linking and breaking away and whirling on unceasingly in their infinite combinations, ever changing yet never being lost. Of all this must we think ere we can sound the depth of the meaning,—"the atoms despise" us.

Conversing recently with one of our greatest English divines, he said to me, the words, "The Name comes close behind a stomach cyst," conveyed no idea whatever to his mind; and he adduced that as one of his reasons for thinking Browning obscure. This gave me the opportunity of pointing out to him that if he had spent a small fraction of the time he had devoted to Greek particles to learning the elements of biology, he would not have so unjustly condemned the poet. This is a good illustration of the mental preparation which is demanded in a Browning student. Is the fault with the poet? By no means. A good preacher has a right to good listeners. Professor Max Müller recently said, that neither Tennyson nor Browning could be understood

without an acquaintance with the Greek and Roman classics; this is presupposed in our idea of an educated person. In Browning's case a knowledge of the physical sciences is also demanded of us; but this only shows that Browning is in advance of his time, as a leader of men should be. The age cannot be very distant when an acquaintance with science will be as common as a knowledge of the ancient classics: then we shall hear less of Browning's obscurity. Browning's theory of life is eminently in accord with the teachings of evolution and development. At first the savage merely lives the animal life; in time he comes to learn *how* he lives,—

> "and the more he gets to know
> Of his own life's adaptabilities
> The more joy-giving will his life become."

The very failures of our life prove it to be an advance from a lower form, as the poet shows in *Cleon*. "The moral sense grows but by exercise," and if it be true that "an honest man is the noblest work of God," it is impossible to imagine how he could have attained his nobility by any other means than the "training and passage" of this life. Browning's theory of

life is scientific because he goes into its purpose; and what to the pessimist is infinite mystery is replete with law and order to him. Poor atheist Thompson, who wrote *The City of Dreadful Night*, exclaimed,—

"I find no hint throughout the universe
Of good or ill, of blessings or of curse;
I find alone necessity supreme.

"The world rolls round for ever like a mill;
It grinds out death and life, and good and ill;
It has no purpose, heart, or mind, or will."

It was natural that such pessimism should lead to the Lethe of opium and alcohol, and the melancholy end in the wards of the hospital. To the healthy mind of Browning—

"This world's no blot—
Nor blank: it means intensely and means good."

The evolutionist has taught us many things as to the origin and development of bodily organs. It is not more certain that necessity has gradually produced and improved these than that—

"As with body so deals law with soul,
That, stung to strength through weakness, strives for good
Through evil."

The pessimist who fails to see all this is like

a colour-blind person who cannot find the beauty of the rainbow. It is not the bow in the clouds which wants colour, it is his deficiency of the colour-sense which is to blame. Looking back at the history of our race, we can find no noble deed, no heroic effort, which could ever have sprung from the pessimist's gloomy creed. Mental health means optimism. This is the oxygen of the soul, and there never was a brave and valiant effort made without it. The fatal choke-damp of the poets of the Leopardi and Schopenhauer school finds no place in the robust pages of Browning. It vitiates much of the work of Shelley, Byron, and Heine, but probably no poetic atmosphere so nearly approaches mountain air as his. If anything, it is too strong for most of us in the old world. The newer blood and stronger lungs of the new world breathe it with greater pleasure.

Contemplating the lower forms of life, the poet sees that they have arrived at perfection; the star-fish is complete,—no better star-fish seems required,—but he sees—

> "Man, for aye removed
> From the developed brute; a god though in the germ."

On this he grounds his belief in the immortality of the soul:—

"Life is probation, and the earth no goal
But starting-point of man; compel him strive,
Which means, in man, as good as reach the goal."

God, the soul, the future life; earth, the school-time; love, the one great lesson to learn; character to be evolved from the contest with evil; the substratum of good in every soul which leaves always some possibility of restoration; the imperishable nature of all good and the ever-diminishing sum of evil,—these are the high themes of the poet's work, and there is nothing grander in the intellectual condition of our time than to see this noble, robust, old Anglo-Saxon standing amidst the wrecks of the creeds and the crumbling ruins of the Churches to proclaim that all which is best and most instinct with life and power in our religion is based on eternal fact, and nowise to be shaken by criticism or disturbed by the progress of the ages. This man speaks to us with authority, "Crowned by prose and verse and wielding with wit's bauble, Learning's rod, ... he at least believes in soul and is very sure of God!"

PARACELSUS:
THE REFORMER OF MEDICINE.

LET us go back in thought to the middle of the fourteenth century, which saw the birth of the period known as the Renaissance or Revival of Learning, and which preceded the dawn of the Reformation. The early part of the century was the glacial period of European thought; all real intellect was enchained in "thrilling regions of thick-ribbed ice." The religious condition of Europe at this time is familiar to every student of history. It is with science we have now to deal. For nearly two thousand years the philosophy of Aristotle had reigned supreme over all Europe. Hallam tells us that "what the doctors of the Middle Ages had been in theology, that was Aristotle in all physical and speculative science, and the Church admitted him into an alliance of dependency for her own service." From the domination of this system, which kept the human mind in bondage, there seemed no

escape. Men had grown to love their thraldom. But this philosophical deity was not the real Aristotle, but Aristotle converted to Christianity and dressed in a monk's frock. The world had worshipped the sage as a Hebrew, then as a Moslem, now as a Christian and a pedant. Knowledge in the schools "revolved like a squirrel in a cage;" henceforth, after two thousand years of turning about upon itself, it was to progress.

If religious thought was restricted and controlled, science was bound hand and foot and hidden in darkest dungeon. Pietro of Abano, the greatest philosopher and physician of the preceding century, was so successful in curing diseases, so skilful a builder and astronomer, that he was held to be a wizard, and condemned to be burnt alive. This was the common reward of any who ventured to take a single step forward on the path of human progress.

Less known than the martyrs of religion, the noble army of the martyrs of science have perhaps a greater and more lasting claim upon our gratitude. The former found in their faith itself its own supreme reward; they were

upheld by its transcendent support and were sustained by supernatural consolations. The martyrs of science had nothing to cheer them but the sad smile of truth and the consciousness that their vindication was ultimately secure. The Reformation was but a portion, and that by no means the most important part, of the great Renaissance; it was a natural outgrowth of the Revival of Learning. This may be said to have commenced in 1453, when Constantinople fell into the hands of the Turk. "The new learning now began to awaken free thought," says Mr. Symonds; "it encouraged curiosity, and prepared the best minds of Europe for speculative audacities from which the Schoolmen would have shrunk, and which soon expressed themselves in acts of cosmopolitan importance." The great melting period of the glaciers was from 1492 to 1500. Columbus discovered America, and the passage to India was found. Printing was growing into vigour, and the art of war being revolutionized by the invention of gunpowder, and the discoveries of Copernicus had effected no less a revolution in the science of cosmology. Luther was born in 1483. Ten years later

Paracelsus, the Luther of medicine and of chemical science, was born at Einsiedeln, near Zurich. It is not hard to recall these Reformation scenes as one stands on the Rhine bridge at Basle, watching the tumultuous flow of the river, itself formed by the melting of the ice and snow of the Alps above. We naturally think, as we stand there, of another breaking up of ice, and the source and progress of another river taking its rise in these lands. Close by the Rhine we see the cathedral in which are the tombs of Erasmus and Œcolampadius and other pioneers of modern thought; but the Browning student's reflections will be centred on the University buildings close by the bridge. At this University Paracelsus—the first teacher, be it remembered, who ever held a chair of physical science—worked and taught in 1526; here he was nicknamed "Luther Alter"—the other Luther. Up to the time when, in 1835, Mr. Browning wrote his poem *Paracelsus*, the world had nothing but a distorted image of the hero, which was, in fact, little better than a caricature drawn by his bitter enemies. Mr. Browning's vast research amongst contemporary records has enabled him to put together

—like Professor Owen with his prehistoric bones—a consistent and faithful figure of the real man. When Mr. Browning says, in the notes appended to the poem, that the liberties he has taken with his subject are very trifling, we now know this to be the fact, because we have access to the documents which confirm his estimate of the hero's life. In all history it would be difficult to find another character which has been so slandered and misrepresented as that of Paracelsus. He was the son of a physician, William Bombast von Hohenheim, who taught him the rudiments of alchemy, surgery, and medicine; he studied philosophy under several learned masters, chief of whom was Trithemius of Spanheim, Abbot of Wurzburg, a great adept in magic, alchemy, and astrology. Under this teacher he acquired a taste for occult studies, and formed a determination to use them for the welfare of mankind. He could hardly have studied under a better man in those dark days. Tritheim himself was well in advance of most of the teachers of his time. As it is impossible to place ourselves in full sympathy with Mr. Browning's hero unless we have some idea

of the perplexing and much misunderstood subject of alchemy, I may be pardoned if I make a short quotation from a book of this same Johannes Trithemius, printed at Passau in 1506. He says: "The art of divine magic consists in the ability to perceive the essence of things in the light of Nature, and by using the soul-powers of the spirit to produce material things from the unseen universe (A'kasa), and in such operations the Above (Macrocosm) and the Below (the Microcosm) must be brought together, and made to act harmoniously. The spirit of Nature is a unity, creating and forming everything, and by acting through the instrumentality of man it may produce wonderful things. Such processes take place according to law. You will learn the law by which these things are accomplished if you learn to know yourself. You will know it by the power of the spirit that is in yourself, and accomplish it by mixing your spirit with the essence that comes out of yourself." By this we see that Tritheim was of the theosophists or mystics, for they are of the same class, and probably, in their German form, derived their origin from the labours of Tauler

of Strasburg, who afterwards, with "the Friends of God," made their headquarters at Basle. The mysticism which is so dear to Mr. Browning, and which finds its highest expression, perhaps, in the poem which we are considering, is not therefore out of place.

The poem opens with a touching scene, where the hero is parting from his beloved friends, Festus and Michal, on the eve of his departure from home, to wander, as was the custom, from University to University as a poor scholar "aspiring to know."

His self-will, his dissatisfaction with his teachers, his mysterious promptings to gain knowledge in some original way, lead his friends, who represent the conservative type of mind, to implore him to stay at home.

"Stay with us! Cast those hopes away
And stay with us!
Man should be humble: you are very proud:
And God, dethroned, has dreadful plagues for such!"

But Paracelsus, though protesting that he is no misanthropist, declares that his "vast longings" urge him forward. Sorcery and magic do not content him as the means of penetrating the

secrets of Nature; he will leave the schools and henceforth be taught of God,—

"Who summons me to be His organ."

And so, leaving "the region of abstractions, fictions, visions, spectral hopes and fears, in the midst of which the intellect," as Mr. Symonds says, "somnambulistically moved upon an unknown way," he goes forth from the little town of Einsiedeln, following the star-gleam of truth, and hearing what he thinks to be the voice of God—because having heard it, go he must :—

"Be sure they sleep not whom God needs,"

he says.

"Why not stay here and learn?" they ask; "converse with the mighty dead, fill out their unfulfilled careers, take up their unsolved problems. Snatch the torch from the tired runners and bear it onward! You will have no books in the desert, you will find no foot-prints in the caves where you will be the first visitor! In the ruined cities where wisdom would not stay, in the ravaged towns which renounced her,"—

"Rejecting past example, practice, precept,
Aidless 'mid these he thinks to stand alone!"

Yes! he accepts all that: he says,—

"I seemed to long
At once to trample on, yet save mankind,
To make some unexampled sacrifice
In their behalf, to wring some wondrous good
From heaven or earth for them, to perish winning
Eternal weal in the act; as who should dare
Pluck out the angry thunder from its cloud,
That, all its gathered flame discharged on him,
No storm might threaten summer's azure sleep."

In these prelusive notes we have Mr. Browning's overture to the drama of "Paracelsus: Hero and Martyr of Science." We shall find all these recur again and again in the harmony to follow.

Mr. Ruskin somewhere divides mankind into three orders of beings: "The lowest, sordid and selfish, which neither sees nor feels; the second, noble and sympathetic, but which sees and feels without concluding or acting; the third and highest, which loses sight in resolution and feeling in work." To this latter class did Paracelsus belong. "I go to prove my soul!" "I shall arrive!" he cries. When a man of this sort comes to feel that

way, go forward he must. As Carlyle says: "Some arrive; a glorious few; many must be lost, go down upon the floating wreck which they took for land. Nay—Courage! These also, so far as there was any heroism in them, have bequeathed their life as a contribution to us, have valiantly laid their bodies in the chasm for us; of these also there is no ray of heroism *lost*, and on the whole, what else of them could or should be 'saved' at any time? Courage, and ever forward!"

We next see Paracelsus in the house of a Greek conjuror at Constantinople. Here Paracelsus *attains*. It is nine years since he took the diver's plunge for the pearl. Has he secured it? solved the mystery of being, reached the grand secret of life? He had not even found its elixir, nor the philosopher's stone, nor the universal solvent. He had discovered modern medicine and the science of chemistry; but though it cannot be said he was unaware of the great consequences which must follow these discoveries, it is certain that he underrated them in comparison with what he had hoped to have achieved. When he left his home, he went to study in the mines of the

Tyrol. That was seeing his way without much circuit first; there he was in the region of fact; if he extracted metals, it must be with pick and shovel instead of cabalistic formulæ. No coaxing and wheedling Nature there, but a fight and a struggle for her treasures. We are told that he learned mining and geology and the use of metals in the practice of medicine. "I see," he says, "the true use of chemistry is not to make gold, but to prepare medicines."

In his sermon on the world's unknown benefactors, Cardinal Newman asks, "Who gave us the use of the valuable medicines for the healing of disease?" and he implies that the inventors are mostly unknown. We shall see what Paracelsus did in this direction. He is rightly termed "the father of modern chemistry." He discovered the metals zinc and bismuth and hydrogen gas, and the medical uses of many minerals, the most important of which were mercury and antimony. He gave to medicine the greatest weapon in her armoury—opium. His celebrated azoth some say was magnetized electricity, and others that his *magnum opus* was the science of fire. He acted as army surgeon to several princes in

Italy, Belgium, and Denmark. He travelled in Portugal and Sweden, and came to England; going thence to Transylvania, he was carried prisoner to Tartary, visiting the famous colleges of Samarcand, and went thence with the son of the Khan on an embassy to Constantinople. All this time he had no books. His only book was Nature; he interrogated her at first-hand. He mixed with the common people, and drank with boors, shepherds, Jews, gipsies, and tramps, so gaining scraps of knowledge wherever he could, and giving colourable excuse to his enemies to say he was nothing but a drunken vagabond, fond of low company. He would rather learn medicine and surgery from an old country nurse than from a University lecturer, and was denounced accordingly and—naturally. If there was one thing he detested more than another, it was the principle of authority. He bent his head to no man. Surely never was there a man with such a wolf-hunger for facts of his own acquisition. And now, estimating all his labours at so low a value, he can go on no longer, and we find him in the magician's house in Constantinople, in search of the universal panacea, if you please.

He is in despair, thinks he has done nothing. The process is too slow for him, though we know he had already done so much. He will learn now by supernatural means, diabolical perhaps, because the process is quicker. He must have rest, too, for his throbbing pulses and gnawing heart. Life and strength are going; he has atrophied his once human heart by purging it of love, and has subdued his whole life to the one purpose to know. Has he been fighting sleep for death's sake perhaps? Is he losing his reason?

> "'God, thou art mind! he cries;
> Crush not my mind, dear God.'"

He learns the secret; he is told that he has missed his life's end by refusing Love, as another lost one has missed his by refusing Knowledge; they two are "halves of one dissevered world."

Love saves others, and self-sacrifice is the surest way of saving one's self. "He alone," says a mystical writer, "who loves, has and is Christ, having in virtue of his love the 'Dissolvent' and the secret of 'Transmutation' in respect of the whole man. Krishna has his Arjun, Buddha his Ananda, Jesus his

John—terms denoting the feminine and tender moiety of the Divine nature." He has learned that true knowledge does not consist in accumulating it for its own sake, but in distributing its fruits in loving work for men. Henceforth the ideal must give place to the actual service as the first condition of the highest internal illumination. To what extent are we to consider this scene at Constantinople historical? The poet's purpose is easy enough to trace. The reformer, the truth-seeker, the cold speculative philosopher has somehow to be brought into sympathetic relations with his fellow-men; he has burned up his human affections in his furnaces, and has cast away as dross his human heart-promptings. As love cannot reach him otherwise, a direct revelation must be vouchsafed to him. Mr. Browning has to convert his ascetic scientist (who has only given up gold making and the search for the philosopher's stone because he sees that a wider and simpler chemistry promises better results) into the successful healer, the blessed physician of the poor and the giver of health to princes; and he does not see a better way of converting him than by revealing the Gospel of Love to him

in a magician's house. There does not appear to be any historical basis for this scene between Aprile and Paracelsus. The real Paracelsus, as we find him in his works, was full of love for humanity; and it is much more probable that he learned his lesson while travelling, and mixing among the poor and wretched, and while a prisoner in Tartary, where he doubtless imbibed much Buddhist and occult lore from the philosophers of Samarcand, than that anything like the Constantinople drama was enacted. Be this as it may, we have abundant evidence in the many extant works of Paracelsus that he was thoroughly imbued with the spirit and doctrines of the Eastern occultism, and was full of love for humanity. A quotation from his *De Fundamento Sapientiæ* must suffice: "He who foolishly believes is foolish; without knowledge there can be no faith. God does not desire that we should remain in darkness and ignorance. We should be all recipients of the Divine wisdom. We can learn to know God only by becoming wise. To become like God we must become attracted to God, and the power that attracts us is love. Love to God will be kindled in our hearts by

an ardent love for humanity; and a love for humanity will be caused by a love to God." It would not have been so dramatic, but I would rather, I confess, have seen Paracelsus slowly working this out for himself amongst his peasants and miners and fellow-soldiers and prisoners, than having it revealed to him as to Saul at Damascus by miracle. I am not quite sure though that this is all that Mr. Browning means us to learn by this scene. May it not be that the great Reformation of the sixteenth century is composed of the art-loving, sensuous, Aprile-like Renaissance, or revival of polite learning, and the scientific awakening which took place in Germany after Luther's Reformation? Lorenzo de Medici might in this connection be the Aprile, and Paracelsus the representative of the scientific spirit. I merely throw this out as subject for discussion. Lorenzo seems very well indicated by the speech of Aprile beginning: "I would love infinitely and be loved."

In the year 1525 Paracelsus went to Basle, where he was fortunate in curing Froben the great printer by his laudanum when he had the gout. Froben was the friend of Erasmus,

who was associated with Œcolampadius; and soon after, upon the recommendation of Œcolampadius, he was appointed by the city magnates a professor of physics, medicine, and surgery, with a considerable salary; at the same time they made him city physician, to the duties of which office he requested might be added inspector of drug-shops. This examination made the druggists his bitterest enemies, as he detected their fraudulent practices; they combined to set the other doctors of the city against him; and as these were exceedingly jealous of his skill and success, poor Paracelsus found himself in a hornets' nest. We find him then at Basle University in 1526, the earliest teacher of science on record. He has become famous as a physician, the medicines which he has discovered he has successfully used in his practice; he was now, in the eyes of his patients at least,—

> "The wondrous Paracelsus, life's dispenser,
> Fate's commissary, idol of the schools and courts."

In the poem he is once more conversing with his friend Festus, who is congratulating him. But he declares that he has not been successful,

and really is at heart most miserable; his very popularity galls him, he feels he is but a zany in a show; public flattery he despises; the incense of the ignorant mob he has never sought; he knows that all this is lowering his mental tone, he is being converted into a quack against his will. Festus reminds him that death retires before his presence, that his skill has often availed to raise "the shattered frame to pristine stateliness," that pain-racked men by his blessed opiate may swoon into a sea of bliss, that he is ordained to free the flesh from fell disease as Luther frees the soul. Men say it is done by magic and such folly; it is however done! Arrogant? Yes, he admits that men may say that of him. He did begin his lectures at Basle by lighting some sulphur in a chafing dish and burning the books of his great predecessors in the medical art, Avicenna, Galen, and others, saying: "Sic vos ardebitis in gehennâ." He boasted that he had read no books for ten years, though he protested that his shoe-buckles were more learned than the authors whose works he had burned. Yet notwithstanding these sentiments he is not inclined to see anything but defeat,

when, after aiming at comprehending God Himself, His works, and all His intercourse with the human mind, he finds himself with life passing away and strength failing, a mere lecturer to "beardless boys, and bearded dotards worse."

It must have been a wonderful spectacle when this new teacher took his place before his pupils. The benches, occupied hitherto by a dozen or two of students, were crowded with an eager audience anxious for the new learning. Literature had been exhumed many years before, and now it was the turn of science! Fancy it, students in the nineteenth century, what honour to have been seated on one of these groaning benches assisting at the disentombment of physical science! Leaving the morbid seclusion of the cloisters, men had given up dreaming for inquiry, and baseless visions for the acquisition of facts. This was the childhood of our science, and its days were bright with the poetry of youth. "You Italy, you Dalmatia, you Sarmatia, Athens, Greece, Arabia, and Israel! Follow me—come out of the night of the mind!" he cries. It is a sight to arouse our enthusiasm, to see in the early

dawn of our modern science this man standing up alone to pit himself against the whole scientific authority of his day. He rises from the crucibles and fires where his predecessors had been vainly seeking for gold and silver, ever and again pretending to have found them and always going empty-handed to a deluded world; henceforth, he says, his alchemy shall serve a nobler purpose than gold-seeking, it shall aid in the healing of disease. He casts aside the sacred books of medicine which have been handed down the ages by his predecessors; destroying them, he declares, with an earnestness which is less tinged by arrogance than by conviction, that these men had been blind guides, that he alone has the clue of the maze; and he forsakes all to follow truth, though she lead him to death. In his generous impulse to serve mankind he has spoken harshly of his opponents. They would not have helped him any way. He was above them, they could not understand him, so they hated him, and he scorned them. As too often happens to such heroes, he forgot the love of his neighbour in his love for mankind.

And here we cannot help pausing to ask

how it was that the art of medicine had failed to make any progress whatever from the earliest Christian times? Paracelsus found his pupils holding fast by the teachings of the School of Salerno, founded by the Arabs; and there seems no ground for supposing that the healing art had made the slightest progress in Europe from the foundation of that school in 1150, except in that branch known as pharmacy. For this stagnation the Catholic Church was chiefly to blame. She enjoined the care of the sick no doubt, but she did nothing to further the progress of medical science; the principal remedies were prayers and relics. Not that there was any scarcity of doctors; there were plenty of Greek, Arabic, and Jewish physicians; but none but rich and powerful persons dare call in their services for fear of excommunication. Benedict IX. and Urban II. in the eleventh century ordered that clerical physicians should only practise within the walls of their monasteries. Neither prelates nor any of the superior clergy were permitted to practise in any branch of medicine. The ignorant and often sensual lower clergy were allowed to act as physicians; but even they were for-

bidden to engage in surgery, for the expressed reason that the Church abhorred the shedding of blood. Teeth-drawing and bleeding were relegated to the lay brethren who were the servants and the barbers of the community; and no doubt from this circumstance we derive the title of barber-surgeons, the extremely interesting history of which body has just been published in the "Life of Vicary," where the story of the foundation of Bartholomew's Hospital is told by our President, Dr. Furnivall,* and his talented son, Mr. Percy Furnivall, who is a distinguished pupil of that school of medicine; these gentlemen have done a great service to the history of medicine in England by their labours in that work. Why did the Church oppose the study of medicine? The answer is simple. In those days everything which tended to withdraw the veil of mystery from the secrets of life was considered to have a tendency to destroy religion. The Church seemed unwilling to have the secrets of life explained. Everything which tended to account for the processes of being and the

* This paper was read before the Browning Society.

causes of health and disease was so much withdrawn from the privileges of the Church. Paracelsus had burst his bonds, had in some marvellous manner come to see that a clean sweep must be made of all this Arabian, Kabalistic, Scholastic rubbish before he could begin to teach anything. On the day that he stood up before that audience at Basle University he was to write the first lines of the principles of rational medicine. Do you grudge him a clean slate? Away then with "Ætius, Oribasius, Galen, Rhasis, Serapion, Avicenna, Averroës," and the other blocks. To the influence of relics, theological conjuration, and all the ridiculous and often disgusting remedies of his professional brethren he had opposed his scientific common-sense method of dealing with disease. He had saved the life of a prince who was at first grateful; but when the monks had pointed out that a want of respect had been shown to the Sudarium of our Lady, and the abbey where it was kept had been defrauded of its dues by this indecently hasty cure, the convalescent prince had to prove his orthodoxy by burning a dozen heretics straight away in the public square; and he would doubt-

less have burned Paracelsus too for sorcery had he not escaped from his power. They had sent him diplomas, he tells his friend Festus, and presents from Germany, France, and Italy, and what he valued more than these: he had received a letter from Erasmus, whose friend Frobenius, he says, he had raised from the dead. But all these things are a poor solace at best; and he confesses that a host of petty, vile delights now supply the place of his dead aims, "as sickly fungi spring from the roots where tall trees used to flourish." Then his first desire infinitely to know comes back in all its force, and he declares—

> "Would God translate me to His throne, believe
> That I should only listen to His word
> To further my own aim!"

He has fallen low, but though he cannot soar he will not crawl; he knows that he precedes his age, he has bartered sleep in vain.

They tell him there is another world to remedy the ills of this; but he bursts out:—

> "Another world!
> And why this world, this common world, to be
> A makeshift, a mere foil, how fair soever
> To some fine life to come?
>
> . . . .

No, no;
Love, hope, fear, faith—these make humanity!"

In 1528 we find him at Colmar in Alsatia. He has been driven by priests and doctors from Basle; he says woefully:—

"Poor Paracelsus is exposed
At last; a most egregious quack he proves."

He had been called to the bedside of some rich cleric who was ill; he cured him, but so speedily that his fee was refused. Though not at all a mercenary man (for he always gave the poor his services gratuitously), he sued the priest; but the judge refused to interfere, and Paracelsus used strong language to him, and had to fly to escape punishment. We must not be too hard upon the canon. Disease was treated with profound respect in those days, and great patients liked to be cured with deliberation and some ceremonial. Heart-broken and indignant at the world's ingratitude, Paracelsus now declares he will moderate his aims, abandon his vast ambitions, live the common life, cast out his lovely fancies, and earn his grave, for mind is only disease and natural health is ignorance. He is desperate—he

chants the song of the men who "clung to their first fault and withered in their pride."

The closing scene of the drama is laid in a cell in the hospital of Salzburg. It is the year 1541, his age but forty-eight; and the divine martyr of science lies dying. Recent investigations in contemporary records have proved that he had been attacked by the servants of certain physicians who were his jealous enemies, and that in consequence of a fall he sustained a fracture of the skull, which proved fatal in a few days. There is nothing in the whole range of our literature grander or more beautiful than this death-scene, as painted by Robert Browning. His faithful Festus, watching the weary night long by the sinking champion of the truth, prays for his recovery, for his salvation.

"Save him, dear God; it will be like Thee: bathe him
In light and life! Thou art not made like us;"

He declares that,—

"Come weal or woe
His portion shall be mine. He has done well.
I would have sinned, had I been strong enough,
As he has sinned. Reward him, or I waive
Reward! If Thou canst find no place for him,
He shall be king elsewhere, and I will be
His slave for ever. There are two of us."

Turning to the dying hero he says,—

"God shall take thee to His breast, dear spirit,

. . . . .

And here on earth
Shall splendour sit upon thy name for ever—

. . . . .

Thee—the master mind,
The thinker, the explorer, the creator!"

The dying man sits up, must speak, must sing his death song. Once more he must wear his scarlet fur-lined robe, with his chain about his neck, and his trusty sword Azoth in his grasp. He reviews his life, owns his sins and his failure, owns too his pride and his unspeakable despair, laments that he had misunderstood his place and mission. Still he protests that he never fashioned out a fancied good distinct from man's.

"God is glorified in man,
And to man's glory vowed I soul and limb;
Afterwards they will know me."

Such is Mr. Browning's study of the Real Paracelsus, the Medical Ishmael. He was buried in the churchyard of St. Sebastian at Salzburg; but in 1752 his bones were removed to the porch of the church, and a monument

was erected to his memory by the archbishop. When his body was exhumed it was discovered that his skull had been fractured during life. How different the story is from the previous caricatures in our biographical dictionaries a very little research will show. "Charlatan," "drunken empiric," "conjuror," "sorcerer," "quack," "extravagant impostor." This is how he was described before Mr. Browning wrote. He could read between the lines of his history, and was the first in our time who refused to accept the common story as true. If you refer to the article "Alchemy" in the last edition of the *Encyclopædia Britannica*, you will find that men of science now recognise Mr. Browning's great poem as a far truer estimate of the man's work than any we had previously. He had errors, but they were mainly the fault of his time; his virtues were his own. Was he a charlatan? Men have said so while appropriating his discoveries and passing them off as their own. Charlatans are not often great discoverers or inventors. A drunken empiric? because he frequented the society of common people, instead of watching his alembic in a lonely tower. His profession did not at all

approve of his delivering his lectures in the vulgar tongue, in place of the Latin language; but this was part of his noble plan, and was the beginning of free thought in science; he laboured for humanity, not for a profession. He cured poor people without taking his fees; this was bitterly resented by his brethren. Medical men did not then do as much work for charity as they happily do now. He is gravely charged with being an empiric, as if medicine even at the present day were not largely empiricism. Sir Morell Mackenzie says as much. But Paracelsus did more for scientific medicine than perhaps any of its students. True, he rejected anatomy; but then he made the grand discovery that Nature was sufficient for the cure of most diseases. He was a Neo-Platonist, and considered the mind had more to do with disease than the body. There was much truth in that. "Imagination is the cause of many diseases; faith is the cure for all," he says. Just this doctrine is being taught now largely in America with some success, under the name of "Christian science healing."

Mr. Browning seems too readily to admit the charge of drunkenness so persistently

brought against his hero. In the 4th Scene he makes him accuse himself in the strongest terms. He speaks of his "heart, which God cursed long ago," as now a pet nest for devils. He speaks of his "degradation," of being "half stupid and half mad." We saw how, in the previous scene, he spoke of the host of petty, vile delights which like fungi had usurped the place of his dead aims. This is dramatic, and it has some historical colour no doubt. Mr. Browning even gives us a note to the effect that "his defenders allow the drunkenness." But we ask, Is it reasonable? We know how this man's character has been misrepresented in so many ways—we can see that much of his so-called arrogance was inspiration, and inspiration so far beyond the conception of the narrow, bigoted, grossly ignorant monkish minds about him that the inspiration of genius was probably mistaken ofttimes for that of wine. We know how many charges his secretary Oporinus trumped up against him. May he not have largely exaggerated this account of his lecturing in a state of intoxication day after day? Is it reasonable? Consider the work the man did. Here we have some 106 treatises on Medicine,

Alchemy, Natural History and Philosophy, Magic, and other subjects, written within a period of time covering fifteen years. He had a great practice and crowds of pupils, was a constant and persistent persecutor of Nature for the purpose of extracting her secrets; how could he have accomplished a work the value of which we are now only just beginning to appreciate, if he lived in that state of constant intoxication which Mr. Browning says his defenders admit? We may guess how much of all this is true by remembering what certain historians have said of Luther, and indeed of all the Reformers. He was called an "ignorant vagabond." In truth he was no lover of books, and despised mere University learning. "The book of Nature," he affirmed, "was that which the physician should read, and to do so he must walk over its leaves." We pore over books now till our faculties of observation become atrophied. Paracelsus' library, we are told, consisted of a Bible, St. Jerome on the Gospels, a volume on Medicine, and seven manuscripts. So, as he travelled so much and read so little, what could the musty old pedants who spent their lives amidst the disputations of the School-

men consider him but an "ignorant vagabond?" What are we to say about his magic and astrology? There are two kinds of magic—black and white. The former is devil worship, the latter is synonymous with occult science, or divine science, as it was sometimes called. Mr. Browning makes his hero abjure the "black arts" and the aid of "sullen fiends" and "fallen spirits" in the outset of his career; and though we find him soon after inquiring in the conjuror's house, it does not appear that the poet has sent him thither to learn anything from the devil, that would certainly be at variance with anything we can discover in his authentic works.* By magic in his writings we are to understand, he says, "the highest power of the human spirit to control all lower influences for the purpose of good." He talks a great deal of superstitious nonsense in this connection, but

* He seems to have had a very poor idea of the devil's power. In his book entitled *Philosophia Occulta*, he says, "The devil has not enough power to mend old broken pots, much less to enrich a man." He goes on to say, "That which is unexpected will in future prove to be true, and that which is looked upon as superstitious in one century, will be the basis for the approved science of the next."

there is no evidence of his dealing with the powers of darkness, as was of course charged upon him by the Church on account of his remarkable success. He was an alchemist, and alchemy stands in the same relation to modern chemistry that astrology does to astronomy. We should treat neither with contempt; they have too great a claim upon us for what they gave birth to. And here I must be permitted to touch briefly on the subject of the cosmology of Paracelsus. I dare say some of us have thought, when reading that wonderful death song which the poet puts into the mouth of his hero, that there was in it a great deal more of Mr. Browning than of Paracelsus. I confess I have often thought that myself; but a more careful study of the works and opinions of this thinker and explorer has convinced me that these lovely lines are quite in accord with what we may expect the real Paracelsus to have said. To fully understand the purport of the lines where the poet speaks of man as—

> "The consummation of this scheme
> Of being, the completion of this sphere
> Of life; whose attributes had here and there
> Been scattered o'er the visible world before,

Asking to be combined, dim fragments meant
To be united in some wondrous whole,
Imperfect qualities throughout creation,
Suggesting some one creature yet to make,
Some point where all these scattered rays should meet
Convergent in the faculties of man,"—

and to see the reasonableness of thus making Paracelsus talk evolution, we must know a little of his cosmology and of his curious teaching about the Macrocosm and the Microcosm. We know that his eagerness to understand the relation of man to the universe led him to the study of the Kabala, where this relationship is attempted to be explained. Much of his visionary cosmology has been evidently derived from this curious Jewish work. The Kabala teaches that the whole universe was incomplete, and did not receive its finishing touch till man was formed, who is the acme of the creation and the Microcosm. In the *Zohar*, iii. 48, we read: "As soon as man was created everything was complete, including the upper and nether worlds, for everything is comprised in man. He unites in himself all forms." By the Macrocosm then we are to understand the universe, including the visible and invisible things; by the Microcosm we mean the little

world, a term usually applied to man. It was held not only that there was a relationship between man and the forms of life below him, but also between his spiritual body and the planets, and on this Wiegel says: "The external heaven, with its continued revolution, hath a most convenient correspondency with the inward heaven in the Microcosm, and this with that." This was fully believed by Paracelsus; and though to modern science it seems very absurd, the belief had a definite and useful influence. It is not quite so absurd perhaps as we may think. He says: "The human body is composed of primeval stuff," what we now term cosmic matter. Now the spectroscope has proved that the same chemical elements of which the earth and sun are composed are found in all the stars. In Haeckel's *History of Evolution* there is a series of plates illustrating the various consecutive aspects of the human embryon. These make up a perfect picture of the microcosmic development. If we were to place them side by side with Mr. Browning's lines, they would form their best commentary. (I wish the Browning Society would publish them.) This poem, we must

bear in mind, was written in 1835, twenty-three years before Darwin and Wallace familiarized the world with the doctrine of evolution. "Nature," says the poet, "is nothing but a thought of God reflected in the life of man." *

"God is the perfect poet,
Who in His person acts His own creations."

This is just the idea of the Kabalists and Paracelsists; they say, "The material universe is a thought of the Eternal Mind thrown into objectivity by its will, and crystallized into matter by its power"; to them "all stars and mountain peaks are thoughts of the Eternal Mind." † "The visible body of the invisible God," says Paracelsus. Matter to him was not dead. He says: "Matter is, so to say, coagulated vapour, and is connected with spirit by an intermediate principle which it receives from the spirit."

We cannot understand Paracelsus and the science of his time without a little inquiry as to what was meant by the search for the philo-

* So Balzac: "Dieu est le poète," and Petronius: "Mundus totus exercit histrionem."

† Dr. Hartmann's *Paracelsus.*

sopher's stone, the elixir of life, and the universal medicine. It is very difficult to discern what was really intended by these phrases. Dr. Anna Kingsford, who paid considerable attention to the hermetic philosophy, says: "These are but terms to denote pure spirit and its essential correlative, a will absolutely firm and inaccessible alike to weakness from within and assault from without." Another writer ingeniously tries to explain the universal solvent as really nothing but pure water, which has the property of more or less dissolving all the elements. His alcahest—as he termed it—as far as I can make out, was nothing more than a preparation of lime; but writers of this school only desired to be understood by the initiated, and probably the words actually used meant something quite different. There was a reason for using an incomprehensible style, for fear of the persecutions of the Church; and these books, like the rolls in Ezekiel, were "written within and without." Many great truths, we know, were enshrouded in symbolic names and fanciful metaphors.

It is certain that Paracelsus, like his predecessors, sought to possess the elixir of life.

It does not appear from his writings that he thought it possible to render the physical body immortal; but he held it to be the duty—as the medical profession holds it still—of the physician to preserve life as long as possible. A great deal of matter attributed to Paracelsus on this subject is spurious; but there are some of his authentic writings which are very curious and entertaining. He describes the process of making the Primum Ens Melissæ, which after all turns out to be nothing but an alkaline tincture of the leaves of the common British plant known as the Balm, or *Melissa Officinalis*. Some very amusing stories are told of the virtues of this concoction by Lesebure, a physician to Louis XIV., and which speak volumes for the credulity of the doctors of those times.

Mr. Browning makes his hero say to his friend Festus, when he tells him that his wife Michal is dead,—

> "I have no julèp, as men think,
> To cheat the grave;"

and this little point is typical of the historical accuracy of the poet's work.

Another of his great secrets was his Primum Ens Sanguinis. This is extremely simple; being nothing more than the venous injection of blood from the arm of "a healthy young person." In this we see that he anticipated our modern operation of transfusion.

His doctrine of signatures was very curious and most absurd. He thought that "each plant was in a sympathetic relation with the Macrocosm, and consequently with the Microcosm." "This signature," he says, "is often expressed even in the exterior forms of things." So he prescribed the plant we call Euphrasy or "Eye-bright" for complaints of the eyes, because of the likeness to an eye in the flower; small-pox was treated with mulberries, because their colour showed that they were proper for diseases of the blood.

This sort of thing still lingers in country domestic medicine. *Pulmonaria officinalis*, or Lungwort, so called from its spotted leaves, looking like diseased lungs, has long been used for chest complaints. Michael Drayton, in his *Polyolbion*, describes one of the herbalists, and tells us how he went to work with his simples:—

"For them that are with newts, or snakes, or adders stung,
He seeketh out a herb, that is called adder's tongue
As Nature it ordain'd its own like hurt to cure,
And sportive did herself to niceties inure."

As Emerson says:—

"The old men studied magic in the flowers,
And human fortunes in astronomy,
And an omnipotence in chemistry,
Preferring things to names, for these were men,
Were unitarians of the united world,
And, wheresoever their clear eye-beams fell,
They caught the footsteps of the SAME."

Of course we see nothing of all this; the plants have nothing to tell us, since—

"We ask their pottage, not their love."

Now-a-days this all seems very silly; but we must not despise the ways we came by our knowledge of things. Mr. Tyler says: "Analogy has always been the forerunner of scientific thought;" and we know that even magic had its uses in the beginnings of science.

What was the "cross-grained devil in my sword" of which he tells Festus in the third scene? Mr. Browning says it was azoth, or simply "laudanum suum." If so, why "cross-grained devil?" Writers on magic, of whom

Dr. Hartmann is one, describe azoth as being "the creative principle in Nature; the universal panacea or spiritual life-giving air — in its lowest aspects, ozone, oxygen, etc." Much ridicule has been cast upon Paracelsus for his belief in the possibility of generating homunculi, but after all he may only mean that chemistry will succeed in bridging the gulf between the living and the not-living by the production of organic bodies from inorganic substances. This may perhaps ultimately be done, though we know it has not hitherto been effected.

We must be to some extent familiar with the philosophy of Paracelsus. That Mr. Browning is a mystic I presume no one will deny; hence his sympathy with this mystical theosophist. Take, for example, the beautiful lines in the first part of the poem beginning—

> "Truth is within ourselves.
>
> . . . . .
>
> There is an inmost centre in us all
> Where truth abides in fulness; and around,
> Wall upon wall, the gross flesh hems it in."

Before we can clearly see the idea expressed in these lines, we must know that Paracelsus held that the constitution of man consists of

seven principles: (1) The elementary body. (2) The archæus (vital force). (3) The sidereal body. (4) The animal soul. (5) The rational soul. (6) The spiritual soul. (7) The man of the new Olympus (the personal God). Those who are familiar with Indian philosophy will recognise this anthropology as identical with its own. Paracelsus, in his *De Natura Rerum*, says: "The external man is not the real man, but the real man is the soul in connection with the Divine Spirit." We understand now what Mr. Browning means when he says that knowing is opening the way to let the imprisoned splendour escape.

He was called a quack and impostor because he cured sick folk by unaccustomed methods. We have baptized these methods now, and given them orthodox names. Thus does the quackery of to-day, like its heresy, become the orthodoxy of to-morrow. We may forgive this man his wrathful arrogance and boastfulness "for the sake of the indomitable hardihood with which he did lifelong battle, single-handed, against enthroned prescription," says a recent writer. Into the tangled undergrowth of theosophy, mysticism, magic, and theology,

he burst with the pioneer's hatchet of chemical experiment and clinical observation, and cleared a path for physical science. The path was narrow it is true, it led through many a dangerous place; but it is the same road which greater engineers have improved for our use to-day. Here is your true Pathfinder and Pontifex Maximus! He belonged to the highest order of men, that of the initiators who are the guides of mankind, who, bearing aloft the torch of intellect, plunge into the regions of the unknown, and call on us to follow them. New ideas to men of his type are as the oxygen we breathe—they cannot help doing great things. I said that some of his apparently absurd notions had a basis of truth. Let me give an instance of this: his idea that all Nature was living, and that there is nothing which has not a soul hidden in it—a hidden principle of life—led him to the conclusion that in place of the filthy concoctions and hideous messes that were in vogue with the doctors of his time, it was possible to give tinctures and quintessences of drugs, such as we now call active principles—in a word, that it is more reasonable and pleasant to take a grain or two of quinine than

a tablespoonful of timber. He set himself to study the causes and the symptoms of disease, and sought a remedy in common-sense methods. Mr. Browning is right when he makes him say he had "a wolfish hunger after knowledge;" and surely there never lived a man whose aim was to devote its fruits to the service of humanity more than his. After this brief study of his life and character, how faithful seems the estimate of the poet to the life-passion of the hero!

What wondrous good has he brought, Prometheus-like, from heaven? Let me tell you just one. A child was burned the other day from head to foot; in terrible agony it was taken to the hospital, in an hour it was calmly sleeping. A man at work upon the front of a house lost his footing, fell, was impaled upon the railings; he too was taken to the hospital, in a short time he also was asleep. Both had the blessed tincture of opium invented by Paracelsus; and in Browning's words:—

> "Men in racking pains may purchase dreams
> Of what delights them most, swooning at once
> Into a sea of bliss."

When you think of pain, remember and bless

the memories of Paracelsus, and of Simpson, the discoverer of chloroform. "I precede my age," he says in the poem. There are many hints in his works that he knew a great deal more than he cared to make known. Take this example. He said: "Every peasant has seen that a magnet will attract iron. I have discovered that the magnet, besides this visible power, has another and a concealed power." Again: "A magnet may be prepared out of some vital substance that will attract vitality." Mesmer, who lived nearly 300 years after him, reaped the glory of a discovery made, as Lessing says, by the martyred fire-philosopher who died in Salzburg hospital.

From this study of a soul Mr. Browning evidently desires us to learn at least one great lesson—that neither the intellect without the heart nor the heart without the intellect will avail for the highest service of man by his brother. We are just beginning to learn that the Gospel of the Carpenter's Son is a life to be lived, not a mere creed to be believed. I am not quite sure that Mr. Browning did well to point this moral from the life of his hero. He was only unloving and unlovable when com-

bating the gross stupidity and bigoted ignorance of his brother doctors. He seems to have been in life and death the loving friend of the poor, to whom when he died he left all his goods. But the lesson of the union of heart and head is good to learn from any parable. Think of this. Just about the time of Paracelsus, a company of heretics, about to be burned at the stake, were compelled to listen to a sermon from this text: "If I give my body to be burned, and have not charity, it profiteth me nothing;" and probably the preacher really believed he was preaching the doctrines of Christ. Why has the Gospel of Love survived this perverted systematic theology? Because, after all, the human heart is stronger than the human head.

There is a large and beautiful church in the Roman Campagna built on such a pestilential soil, so deadly in its effects on the atmosphere, that it can no longer be used for worship. Its marble pillars are entwined with luxuriant creepers, its cracked and crumbling monuments are garlanded with lovely southern flowers, lilies and roses grow out of its tombs, and the choir stalls, carved with quaint figures of de-

mons and satyrs, are beds from which spring delicate mosses and fair ferns; the birds build their nests in the traceries of the beautiful storied windows, and the lizard sports on its marble walls, the bats haunt its dark recesses. A solitary monk, as a penance for past sins, says the daily mass before its moss-grown altar, at which no worshipper but himself dares to kneel. Yet the flowers breathe the pestilential atmosphere uninjured, and beautify the ruins on which they grow. "Only gradually," says Professor Graetz, "does religion become humanized." Had not human love, like these fair flowers, softened and adorned the grim and crumbling creations of a pseudo-scientific and dogmatic theology, religion would have long since lost its hold on modern man. To live *to know* alone, is to miss life's end; to live *to love*, for art and beauty and pleasantness alone, is to miss it just as surely as Paracelsus missed it. "And why?" he asks:—

> "In my own heart love had not been made wise
> To trace love's faint beginnings in mankind,
> To know even hate is but a mask of love's,
> To see a good in evil, and a hope
> In ill-success; to sympathise, be proud
> Of their half reasons, faint aspirings, dim

Struggles for truth, their poorest fallacies,
Their prejudice and fears and cares and doubts;
All with a touch of nobleness, despite
Their error, upward tending although weak,
Like plants in mines which never saw the sun,
But dream of him, and guess where he may be,
And do their best to climb and get to him.
All this I knew not, and I failed."

"And this was Paracelsus!"

RABBI BEN EZRA.

FIVE years ago a dozen ladies and gentlemen, living in one of the suburbs of London, arranged to meet together at stated intervals for the purpose of diligently studying the works of Robert Browning. They were moved to this by the fact that a short series of lectures had just been delivered in their neighbourhood by some well-known Browning scholars, notably Dr. Furnivall and Miss Hickey. The plan adopted was simply to take one of the poems in the first series of the Selections,* and go steadily through it, line by line, taking care not to let any thought pass till it was clearly understood by every member of the company. Although, with perhaps two exceptions, the friends were all strangers to the works of the great poet, it was remarked that, in the careful perusal of the poem, which was urged pre-

* *Selections from the Works of Robert Browning.* London: Smith, Elder & Co.

paratory for each meeting, almost every member was able to contribute something towards the elucidation and illustration of even the obscurer lines of the evening's study; and now, looking back at those pleasant meetings, the majority of the little company would, I think, be able to say that their time and attention had been well bestowed in the efforts to master the pregnant and vigorous teaching of Mr. Browning. We began with *Rabbi Ben Ezra*, a well-known and favourite poem, which is popularly considered perhaps as one of the easiest to understand. As it is certainly a work which is very typical of Mr. Browning's philosophy, it may be questioned whether its apparent simplicity will not disappear before the serious attempt to suck each verse dry of its wonderful teaching. The fact is, as the little class soon discovered, the poem is a test of the mental attitude and capacity required to make the Browning student. If, after several perusals, a reader makes up his mind that the author of *Rabbi Ben Ezra* has something to say to him that no other writer has said so well before, let him go on with his study, in Browning he will find the teacher he has been seeking; but if, on the con-

trary, the poem finds in that reader's soul no responsive sentiments starting into life, and harmonizing with its teaching, it is pretty safe to say he will never make a Browningite. It is undoubtedly one of the noblest religious poetical utterances in the language, and will repay all the thoughtful attention we may devote to it; but it is probable this may not strike the reader at the first or even the second perusal. It may be objected that we do not read poetry for the sake of solving riddles, nor for the purpose of mental gymnastics, but for the pleasures of imagination. These are not, however, valid objections to such a poem as *Rabbi Ben Ezra.* There is abundant imagination in it of the most pleasurable sort; but as it deals with the philosophy of life, it must of necessity deal with matters appertaining to the great problems of our earthly pilgrimage. Life is a riddle, after all, and there can be no greater pleasure to the thinking man than the exercise of his mental powers on the great questions of "the whence, the how, and the why." The old Rabbi, towards the close of a long and honourable life, is looking back on the way he has travelled

and forwards towards its goal; and as he stands resting, as it were, to sum up the loss and gain of life, we feel that here, at least, is no mere dramatic utterance, but Robert Browning himself reflecting on the chief end of man, and expressing in profound philosophy what the child says simply in the Catechism, that the chief end of man is to know, love, and serve God in this life, and to be happy with Him for ever in the next. Rabbi Ben Ezra sings in thirty-two stanzas what the child repeats in those few simple words. The poem opens with a plea for a completely developed life; and this claim is made throughout the whole of the poet's teaching. God says,—

> "A whole I planned,
> Youth shows but half."

And so old age is not the mere subsidence and decay of powers that were once high and noble, which are falling into ruin, but the completion, the perfection, of the life ordained by God—

> "The last of life, for which the first was made;"

and which, rightly understood, is actually the best. In the admirable antithesis of this first stanza we have the poet's eulogium on growing

old, if happily we grow old with the noble Rabbi—

"Grow old along with me!"

in the faith and high purpose which sustained him from the outset, as his Bishop Blougram says,—

"Belief or unbelief
Bears upon life, determines its whole course,
Begins at its beginning."

So his—

"Great aim, like a guiding star, above—
Tasks strength, wisdom, stateliness, to lift
His manhood to the height that takes the prize."

And so the stateliness, the wisdom, and the strength, arrived at due completion, will—

"Lead him at his grandest to the grave."

Again and again, like a musician reverting to his great theme, we find, in the poet's works, this praise of a good man's old age, as in the *Inn Album*—

"My life's remainder, which, say what fools will,
Is, or should be, the best of life; its fruit
All tends to root and stem, and leaf and flower."

In the third verse we have another eminent

characteristic of his teaching—the purpose of doubt in the development of soul. With Browning everything must have its purpose. Doubt must be good somehow or other, or we should not find it "rapping and knocking at and entering our souls." The point is—

> "How can we guard our unbelief?
> Make it bear fruit to us?"

And so the Rabbi says,—

> "Rather I prize the doubt
> Low kinds exist without,
> Finished and finite clods, untroubled by a spark"

As the purgatory of the thinker, he finds it almost indispensable to the formation of the highest intellects. He has not much opinion of those who "solely seek and find and feast."

> "Irks care the crop-full bird?
> Frets doubt the maw-crammed beast?"

With maw-crammed, crop-full folk, Browning has little to do; his office is with the man who has taken the key of knowledge and fearlessly descended with him to unlock the dark vaults wherein are laid the foundations of our beliefs and the arches on which rests the superstructure of our faith. He need not fear

to grope his way amid their dark recesses with Robert Browning for guide. With such a Great-heart he shall—

"Face the spectres of the mind, and lay them."

In the sixth verse we come upon another great article of the poet's system of philosophy —the uses of earth's roughnesses, stings, pains, and rebuffs; not the smoothness, but the roughness of life; not the ease, but the sting that bids us go; not the all-pleasant things, but the joys that are three parts pain. These are the stimulants of soul growth, the mind bracers, the steps by which we mount.

Mr. Browning's healthy optimism is well exhibited in the touching lines in the seventh verse—

"What I aspired to be,
And was not, comforts me."

There are lives which succeed, though to outward seeming they may be miserable failures. It is the aspiration which makes the man, as he tells us over and over again, nowhere more grandly than in *Saul.*

"Saul, the mistake,
Saul, the failure, the ruin he seems now—and bid him awake

From the dream, the probation, the prelude, to find himself set
Clear and safe in new light and new life—a new harmony yet.

. . . . . .

'Tis not what man Does which exalts him, but what man Would do!"

Our proper sphere is ever indicated by the direction and intensity of our aspirations and soul strivings. As plants in mines, that never see the sun, tend upwards towards the light, so the inner aim shows the true man.

"Better have failed in the high aim as I,
Than vulgarly in the low aim succeed,"

he says in the *Inn Album.* The same truth is emphasized in *Fifine at the Fair*:—

"I gather heart through just such conquests of the soul,
Through evolution out of that which, on the whole,
Was rough, ungainly, partial accomplishment, at best."

The world is very hard upon the failures, and seldom gives credit even for the working, however good, of the sum which does not come out right. But happily God does not judge after this manner.

"All men strive, and who succeed?"

"What hand and brain rest ever paired?
What heart alike conceived and dared?
What act proved all its thought had been?
What will but felt the fleshly screen?"
The Last Ride Together.

We have the same idea in another form, in the concluding lines of *A Grammarian's Funeral*:—

"That low man goes on adding one to one,
His hundred's soon hit:
The high man, aiming at a million,
Misses an unit."

The tower at Pisa, not falling, but vainly trying to lift its head, is nobler, with all its imperfection, than our Monument, which at least is perpendicular, though, as Pope said,—

"Like a tall bully, it lifts the head and lies."

The noblest commentary on the eighth verse is Lord Tennyson's, *By an Evolutionist*, which commences with the daring line,—

"The Lord let the house of a brute to the soul of a man."

Browning asks,—

"What is he but a brute
Whose flesh hath soul to suit?"

And his teaching is, that the brute's office is first to help soul.

"In our flesh grows the branch of this life, in our soul it bears fruit."

"The angel in man is not to do homage to the brute in man," as Dewey finely says; yet Browning scruples not to defend the body from the macerations of the ascetic; and man, —the whole man,—has a right to the "body at its best." Tennyson says,—

"Hold the sceptre, human soul, and rule thy promise of the brute."

Yes, rule—not destroy! Neither pamper nor crush. "All good things are ours."

What wonder the purpose fails, the will is so weak in a large proportion of our habitual criminal and pauper classes! Go over one of our great convict prisons with an artist and an anthropologist, measure the heads of the criminals, take stock of their brain capacity, study the facial angles, the formation of the head, hear the artist compare the shape and aspect of the prisoners' frame with those of his models, ask the anatomist to point you out the

deficiencies which he finds in their development, and you will say that, in the greater proportion by far, the inhabitants of the dismal abodes of crime were so heavily handicapped by nature that they never could have had a fair start in life. The first necessity of a man's soul is a "body at its best." When statesmen and tax-payers get to know all that is meant by this line of the poet's, a modified form at least of Christian Socialism will not be far off.

"How good to live and learn!"
"Earth being so good, would heaven seem best?"
The Last Ride Together.

"O world, as God has made it! All is beauty,
And knowing this is love, and love is duty."
The Guardian Angel.

"How good is man's life, the mere living! how fit to employ
All the heart and the soul and the senses for ever in joy."
Saul.

This is how Browning all through his works, the healthiest of modern poets, speaks of life. In the whole of his books there is not a single whine; even dramatically, he could not have made his most despicable character utter such a question as, "Is life worth living?"

When it comes to talking like that, there must be a screw loose somewhere. We expect a nineteenth-century poet to be sane. Very fair poetry has, we believe, been scribbled by patients on the walls of a lunatic asylum. Mad poetry may be written, but the day has gone by when it will be read. None but a mentally rickety man or woman ever asked, "Is life worth living?" with any expectation of getting a negative answer; but Browning's mind presupposes Browning's body, and that was "body at its best." To him who longs morbidly for death, Browning sternly says, "Hast thou ever truly lived?" He thanks God that he was a man when he sees the whole design, but it is the complete manhood for which he is thankful. He demands that each element in human nature shall be allowed fair play; it is unfair predominance which spoils the man. Control, restraint, no waste of any faculty.

> "Since require Thou wilt
> At my hand its price, we say!
> What the price is, who can say?"

To understand the full teaching of verse eleven, we should read *Fra Lippo Lippi*, the yearning for rest is so natural, the flesh is so

pleasant; but we want patience, not rest, stimulating to go on—not "by-path-meadows" and "rose-meshes." We are not to expect to make headway by despising the flesh, neither are we to renounce it as a thing accursed; we must accept life on its own terms, as he says in *Sordello*,—

> "To no mad wings transmute
> These limbs of mine."

Life's cup must be quaffed to its extreme dull dregs, and as Fra Lippo Lippi says,—

> "This world's no blot for us,
> Nor blank; it means intensely, and means good.
> To find its meaning is my meat and drink."

Life may err as gravely by being over-spiritual as over-worldly; Browning's mind is too healthy to run into either extreme. The best commentary on the thirteenth verse is that wonderful death-song of Paracelsus in the fifth Act, where the martyr of science, dying in Salzburg hospital, tells of the origin of man from lower forms, and prophesies of the time when,—

> "In completed man begins anew
> A tendency to God."

"Man is not Man as yet,"—

But he is for ever removed from the brute,—

"A god, though in the germ."

Facing death, "fearless and unperplexed," he stood waiting for the last fight, as we see him in *Prospice*, in *Rabbi Ben Ezra*, and notably in the epilogues of his later volumes. In the last page of *Ferishtah's Fancies*, dated December 1st, 1883, we find the noble old man waiting God's "Come!" as a soldier, forward face, no sneak lagging behind, battling it like a man, not boy-like sulking or whining; and so through all his works, till we read the last line his manly pen has traced for us, published to the world on his very death day, still the same,—"one who never turned his back, but marched breast forward," crying, "Speed,—fight on! Strive and thrive!"

The unity of Browning's teaching, and its consistency from first to last, is one of the secrets of his great power. As the soul is held by Browning to be eternal, this life is considered as but the preparatory school-time, the first lessons in warfare are given here; but Browning's Future Life is no Mohammed's Paradise; in the There, as in the here,

he tells us, in his last line of his last poem, we—

"Fight on, fare ever There as here!"

So, in the fourteenth verse of *Rabbi Ben Ezra*, he tells us we shall not be perplexed in our next "brave adventure,"—

"What weapons to select, what armour to indue."

Those of us who saw him laid to rest in the old abbey pictured him going out "from the great deep to the great deep," passing "to be king among the dead," not with grievous wound as Arthur, but full armed, sword in hand, face forward, fighting to the last, unscathed through all. "There is nothing," says Seneca, "more disgraceful than that an old man should have nothing to produce as a proof that he has lived long except his years." The Rabbi having proved the Past, faces the Future judicially. He has accumulated great store of experience, and he estimates the various points of the life-struggle of the past at their true value. Herein he finds no cause for shame; there were errors enough, but they were merely the uncouth acts of the pupil learning his business; the proof that he has really lived is found, not in an

addition sum, but in the real work done; the Man evolved, the God in the germ.

The lesson enforced in the nineteenth verse is the Gospel of Work. "In God's name produce something," said Carlyle. We come nearest to God the Creator when we engage in true work, which is ever sacred and eternal. "Strive *towards* making," says Browning. "Man is purposed to grow, and forced to try and make, else fail to grow." If impossible always to grasp and gain the good beyond, in this is no failure. The mere attempt is growth. He sets all this out in a wonderful passage in the *Ring and the Book*, vol. i. lines 710 to 760. Man repeats God's process in his due degree; if he cannot create, he may at least resuscitate; he may complete the incomplete, breathe on and relume the half-quenched wicks of the lamp. This is the true purpose of youth—its uncouth attempts at making, prepare for an old age exempt from strife, blessed with the privilege of knowledge. Then may he wait the end, and not be afraid. Strive to the end; yes, not blindly, but assured of victory. Almost the last words uttered by the late Lord Shaftesbury were these: "De-

pend on it, we shall beat the devil yet, if we only keep on to the end, and never despair." Youth strives for mere necessity of exercise; that is better than repose. The strife of the Rabbi's age was the strife of "Prospice" for the victory all but assured, the prize all but grasped. Then comes the judgment on the life's work. The vulgar mass men call "work" will often make a very poor figure beside the immature instincts and the unsure purposes which then for the first time will be accurately weighed and measured. "The vulgar mass" took the eye, and had its price; rode in its gilded car, and wore its crown; had its monument, and stands on our roll of fame; had all its reward, and enjoyed all its good things; and the world's coarse thumb and finger plumbed its value, estimated it all without a pause. So much to its mind was it, there was no room for hesitation; its price to the last farthing was paid. But the great thoughts which could never be crystallized into a single poor act the world could ever be brought to notice, the ethereal fancies, the noble aspirations, the longing after God—

"All I could never be,
All men ignored in me;
This I was worth to God."

And God's measure is not coarse; and His balance weighs the evanescent fancy, and His rod measures the depth of the feeling that never struggled upwards into one poor act, and it is all there, and the record which cannot err puts down the mighty from his seat, and exalts the humble and the meek.

"Was I, the world arraigned, right?" Very likely. "Were they, my soul disdained, right?" Perhaps. Truth and peace shall come at last. Some one once said—I remember not where I saw it—"When the British public feels elevated and sublime, it comes to Westminster Abbey to look at the tombstones, and it says, 'Here are *my* great men; they worked for me. I bought them; I paid for them.'" The British public fully appreciates no work till a handsome tombstone assures it that it is safe in doing so; then it takes the eye, then its price is paid. It will flatter itself before long that it has even bought and paid for its Browning! The great lesson of the true estimate of that for which the world's balance is

too coarse an instrument, is that which bids us remember that our aspirations, our ways of life and manner of thought, our seeking after love, and our efforts for good, are all so much real gain for our individual souls, and have an eternal value quite beyond the passing delight and the internal satisfaction they bring, or even the good contributed to the world without.

"There shall never be one lost good!
What was, shall live as before."
"*All* we have *lived* or hoped for or dreamed of good shall exist:
Not its semblance, but itself."

"All I could never be," is the epitaph on many a noble man and woman perished in the cruel east wind of the blighting, hard world. This demands immortality, or life is a poor cheat.

The concluding verses of the poem are occupied with the elaboration of the beautiful metaphor of the potter's wheel—Time phenomenal, God eternal; changing earth, God and soul alone standing sure. That which really is lasts ever.

"Time's wheel runs back or stops: potter and clay endure."

But the change is good for us. It is well that the wheel does turn; by that we are shaped; by that movement "we draw beauty into our heart's core."

> "Rejoice that man is hurled
> From change to change unceasingly,
> His soul's wings never furled!"

So all the plastic circumstance of this life's dance is just that in which the potter has fixed us to give our souls their bent. God planted us just where we grow, and blossom and fruit must be drawn, not from the meadow on the other side of the road, or from the mountain beyond the valley, but from the soil now about our roots, and the air and rain and sun above us playing on our leaves and branches. Yet, fixed as we are, the circumstance is neither iron nor adamant, but plastic for us, for we are not vegetables, but men. The potter's wheel is intended to mould men into cups for the Master's lips. Not in the bowl, not in the stem, with all their quaint device and laughing loves, are found the proper uses of a cup; not the uncouth beginnings of life, not the ornament, but the perfected cup, to slake the Master's thirst. These are the uses

of a cup, flawed, strained, warped, alas! But take, use, and amend Thy work—Thou, not I, the potter! Quaint old Francis Quarles, in one of his emblems, has a prayer which I think must have been in Mr. Browning's mind when he wrote these powerful verses :—

"Eternal Potter, whose blest hands did lay
My coarse foundation from a sod of clay,
Thou know'st my slender vessel's apt to leak :
Thou know'st my brittle temper's prone to break :
Are my limbs brazil, or my flesh of oak?
Oh, mend what Thou hast made, what I have broke :
Look, look with gentle eyes, and in Thy day
Of vengeance, Lord, remember I am clay."

BROWNING AND VIVISECTION.

As we have seen, Mr. Browning's sympathy with the science of his time was both wide and well-informed He was not its slave, was neither blind to its necessary defects as an efficient substitute for religious faith, nor willing to concede all that is demanded in its name. He was early associated with Miss Frances Power Cobbe in her noble and self-sacrificing efforts to expose scientific cruelty in that form especially which is known as Vivisection, or the cutting into live animals for physiological and pathological investigation. Mr. Browning was to the last a Vice-President of the Victoria Street Society for the Protection of Animals, and he always expressed the utmost abhorrence of the practices which it opposes.

The following letter was written by Mr. Browning on the occasion of the presentation of the memorial to the R.S.P.C.A. in 1875 :—

19, WARWICK CRESCENT, W.
Dec. 28th, 1874.

DEAR MISS COBBE,—

I return the petition unsigned, for the one good reason—that I have just signed its fellow forwarded to me by Mrs. Leslie Stephen.* You have heard, "I take an equal interest with yourself in the effort to suppress vivisection." I dare not so honour my mere wishes and prayers as to put them for a moment beside your noble acts; but this I know, I would rather submit to the worst of the deaths, so far as pain goes, than have a single dog or cat tortured on the pretence of sparing me a twinge or two. I return the paper, because I shall be probably shut up here for the next week or more, and prevented from seeing my friends. Whoever would refuse to sign would certainly not be of the number.

Ever truly and gratefully yours,
ROBERT BROWNING.

In his poem *Tray*, the poet describes an

* This lady was Mr. Stephen's first wife, the daughter of Thackeray, and sister of Mrs. Richmond Ritchie.

instance of animal courage and devotion which was witnessed by one of his friends in Paris.

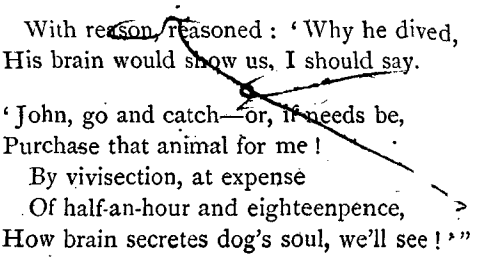
A little girl fell into the river. None of the spectators went to her rescue; but a dog plunged into the water and saved the child; then, to the astonishment of the bystanders, dived again, and after battling with the stream, appeared with the child's doll in his mouth, brought that to land also, and then trotted off as if he had done nothing worthy of praise.

"'Up he comes with the child, see, tight
In mouth, alive too, clutched from quite
A depth of ten feet—twelve, I bet!
Good dog! What, off again! There's yet
Another child to save? All right!

'How strange we saw no other fall!
It's instinct in the animal.
Good dog! But he's a long while under:
If he's got drowned I should not wonder—
Strong current, that against the wall!

'Here he comes, holds in his mouth this time
—What may the thing be? Well, that's prime!
Now, did you ever? Reason reigns
In man alone, since all Tray's pains
Have fished—the child's doll from the slime!'

And so, amid the laughter gay,
Trotted my hero off,—old Tray,—
Till somebody, prerogatived



With reason, reasoned: 'Why he dived,
His brain would show us, I should say.

'John, go and catch—or, if needs be,
Purchase that animal for me!
By vivisection, at expense
Of half-an-hour and eighteenpence,
How brain secretes dog's soul, we'll see!'"

Here the poet ridicules the idea that the seat of the soul can be discovered by a more intimate knowledge of the brain, and bitterly satirizes the heartlessness and base ingratitude of our physiologists who use the dog, notwithstanding his intimate relationship to and friendship for man, as the material for their cruel experiments in the physiological laboratory. Not only did Mr. Browning think this to be useless and wicked, but he denounced it as cowardly even if it could be proved to be useful. In his last volume, published on the day of his death, there is a poem called *Arcades Ambo,* which is a delicate satire on the cowardice of those who advocate vivisection on the ground of its utility in medicine. The poet says that the man who would have animals tortured for the relief of his own pain is as great a poltroon as the soldier who runs away in battle when the balls

fly about. Both shun death, and both are cowards to be scorned.

The advocate of vivisection says :—

"—Shun death at all risks? Well, at some!
True, I myself, sir, though I scold
The cowardly, by no means come
Under reproof, as overbold
—I, who would have no end of brutes
Cut up alive to guess what suits
My case and save my toe from shoots."

When recently I asked Mr. Browning to become a patron of the new hospital to be called the Shaftesbury, and which is to be started for the treatment of patients on principles which exclude vivisection, I received from him the following letter :—

29, De Vere Gardens, W.
August 27th, 1889.

My dear Dr. Berdoe,—

I shall be delighted if the association of my name with those of the patrons of the proposed scheme for an Anti-Vivisectionist Hospital be of the least service in so holy a cause.

Do permit me to take the opportunity of saying how grateful I am to you on other grounds.

Ever truly yours,
Robert Browning.

29, DE VERE GARDENS.

Aug. 27. '89. W.

My dear Dr. Berdoe,

I shall be delighted if the asso-
-ciation of my name with those of
the Patrons of the proposed scheme
for an Anti-vivisectionist Hospital
be of the least service in so holy
a cause.

Do permit me to take the op-
-portunity of saying how grateful
I am to you on other grounds.

Ever truly yours

Robert Browning

Some persons affect to see in this attitude of the great poet proof that he was not imbued with the scientific spirit, that his early religious training and connections had made him afraid of science; but surely a man is no more expected to follow science blindfold than to adopt the same behaviour towards all the claims made for blind adhesion in the name of religion. It would appear though that Science can be quite as exacting as religion in her claims for the entire allegiance of her followers. Mr. Browning resented the arrogance of both. His anti-vivisection sympathies were no mere philanthropic "fads," no mere amiable fancy adopted by chance, or arising simply from kindness of heart. They were demanded by his ethical system, and were the direct outcome of his Philosophy of Life. Love is the one word which sums up his moral teaching; love to God reflected in the Service of Man. To have excluded anything which lives and suffers from the influence of this Love, would have offered violence to the principles which animated every line of his works, from *Pauline* to *Asolando*. Paracelsus and Sordello both failed from want of love, the former especially, by

elevating knowledge to the royal throne of Love, which should dominate the human heart.

> "I seemed to long
> At once to trample on, yet save mankind."

But mankind can never be saved by its tramplers! Love alone, the sole good of life on earth, can be the Saviour of Mankind; and he who violates this principle in any degree, just by so much tramples on mankind. The torture of living animals could never therefore be to Browning the royal road to the Art of Healing. To harden a human heart till the vivisector was fully equipped, was to destroy the very principle which alone, according to his theory, could make a true servant of man. To inflict pain on an innocent animal, that "some fancied good to man" might accrue, was to work with the devil's tools, and to heap up gold that would turn out at last to be but withered leaves.

THE BROWNING SOCIETY.

I CANNOT conclude this little work without some reference to the Browning Society, in which I have taken an active interest almost from its foundation in 1881. "For eight years and a half it has challenged—and in a certain sense compelled—attention to the great merits of the works of the late poet;" and it would be impossible to deny that "it has had some share in effecting the marked change in opinion concerning them." Ten years ago, Browning was ridiculed by every scribbler, and contemned by all the press; now he lies in Poet's Corner in Westminster Abbey. Immediately after the Browning Society was started by Dr. Furnivall and Miss E. H. Hickey, the sale of the poet's works was immensely stimulated, and the volumes that were lying neglected on the publishers' shelves speedily got into circulation; and little wonder. When Mr. Nettleship, Professor Westcott, Archdeacon Farrar, the Revs. Llewellyn Davies, Professor Johnson, Dr. Hiram Corson, Mr. Barnett Smith, Mr. Moncure Conway, the Hon. Roden Noel, Dr. Peter Bayne, Mrs. Sutherland Orr, Mr. Cotter Morrison, Rev. H. R. Haweis, Mr. Holman Hunt, and a host of other men and women famous in Literature and Art lent their valuable aid to the Society, and told the public why the study of Browning was peculiarly good for the men and women of the present day, people began to see that the cheap scribblers of the press had probably misled them, and

were induced to read for themselves. Then the Browning Society in its turn was attacked. It was said that a number of infatuated nobodies met together to adulate the poet, and cover him with their uncritical praise. As a matter of fact, the members of the Browning Society simply met to study the poet's works, as a class might meet to study Thucydides or Homer at College. No one was pledged to indiscriminate admiration of Browning, any more than a student at Cambridge is pledged to admiration of the Greek author he reads in class. We met to learn, feeling sure that the poet was profound and interesting enough to repay the trouble we were put to in the process; and we are doing the same now. We meet once a month from October to June (except in December) on the 4th Friday of every month at 8 p.m., at University College, Gower Street, W.C., for the hearing and discussion of a Paper or Address on some of Browning's poems, or his characteristics. The best Papers, and reports of the discussions, are printed and sent to all the members. The subscription is 21*s.* a year. Our President is Dr. F. J. Furnivall, 3, St. George's Square, Primrose Hill, London, N.W., and names of those who are willing to join the Society should be sent to him. For my own part, I shall be happy to answer any questions, and to give any information about the Society, if inquirers will address me at Tynemouth House, Victoria Park Gate, London, N.E.

00097404

Yours sincerely
